

METHODS OF TREATING CANCER WITH HDAC INHIBITORS

5

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation-in-part of U.S. Application Serial No. 10/379,149, filed on March 4, 2003, which claims the benefit of U.S. Provisional Application No. 60/361,759, filed March 4, 2002. The entire teachings of these applications are incorporated herein by reference.

10

GOVERNMENT INTEREST STATEMENT

This invention was made in whole or in part with government support under grant number 1R21 CA 096228-01 awarded by the National Cancer Institute. The government may have certain rights in the invention.

15

FIELD OF THE INVENTION

The present invention relates to methods of treating cancers, e.g., leukemia. More specifically, the present invention relates to methods of treating acute and chronic leukemias including Acute Lymphocytic Leukemia (ALL), Acute Myeloid Leukemia (AML), Chronic Lymphocytic leukemia (CLL), Chronic myeloid leukemia (CML), and Hairy Cell Leukemia, by administration of pharmaceutical compositions comprising HDAC inhibitors, e.g., suberoylanilide hydroxamic acid (SAHA). The oral formulations of the pharmaceutical compositions have favorable pharmacokinetic profiles such as high bioavailability and surprisingly give rise to high blood levels of the active compounds over an extended period of time.

25

BACKGROUND OF THE INVENTION

Throughout this application various publications are referenced by arabic numerals within parentheses. Full citations for these publications may be found at the end of the specification immediately preceding the claims. The disclosures of these publications in their entireties are hereby incorporated by reference into this application in order to more fully describe the state of the art to which this invention pertains.

30

Cancer is a disorder in which a population of cells has become, in varying degrees, unresponsive to the control mechanisms that normally govern proliferation and differentiation.

Leukemia is a cancer of the blood cells, mostly white blood cells. Each year, nearly
5 27,000 adults and more than 2,000 children in the United States are diagnosed with leukemia. Leukemia occurs in males more often than in females and in white people more often than in black people.

Certain risk factors increase a person's chance of developing leukemia. For example, exposure to large amounts of high-energy radiation increases the risk of
10 contracting leukemia. Some research suggests that exposure to electromagnetic fields is a possible risk factor for leukemia. Certain genetic conditions can increase the risk for leukemia. One such condition is Down's syndrome. Children born with this syndrome are more likely to get leukemia than other children. Workers exposed to certain chemicals over a long period of time are at higher risk for leukemia. Also, some of the drugs used to
15 treat other types of cancer may increase a person's risk of developing leukemia.

Most patients with leukemia are treated with chemotherapy. Some patients also may have radiation therapy and/or bone marrow transplantation.

There are several types of leukemia. Leukemia is either acute or chronic. In acute leukemia, the abnormal blood cells are blasts that remain very immature and cannot carry
20 out their normal functions. The number of blasts increases rapidly, and the disease becomes worse quickly. In chronic leukemia, some blast cells are present, but in general, these cells are more mature and can carry out some of their normal functions. Also, the number of blasts increases less rapidly than in acute leukemia. As a result, chronic leukemia worsens gradually.

25 Leukemia can arise in either of the two main types of white blood cells: lymphoid cells or myeloid cells. When leukemia affects lymphoid cells, it is called lymphocytic leukemia. When myeloid cells are affected, the disease is called myeloid or myelogenous leukemia. The most common types of leukemia are:

A) Acute Lymphocytic Leukemia (ALL) is the most common type of leukemia in
30 young children. This disease also affects adults, especially those age 65 and older.

B) Acute Myeloid Leukemia (AML) occurs in both adults and children. This type of leukemia is sometimes called acute Nonlymphocytic Leukemia (ANLL).

C) Chronic Lymphocytic Leukemia (CLL) most often affects adults over the age of 55. It sometimes occurs in younger adults, but it almost never affects children.

D) Chronic Myeloid Leukemia (CML) occurs mainly in adults. A very small number of children also develop this disease.

5 E) Hairy Cell Leukemia is an uncommon type of chronic leukemia.

Treatment of leukemia includes chemotherapy, radiation therapy, bone marrow transplantation, or a combination thereof.

10 In general, chemotherapy in clinical cancer therapy can be categorized into six groups: alkylating agents, antibiotic agents, antimetabolic agents, biologic agents, hormonal agents, and plant-derived agents. Chemotherapy kills cancer cells directly by exposing them to cytotoxic substances, which injure both neoplastic and normal cell populations.

15 Cancer therapy is also being attempted by the induction of terminal differentiation of the neoplastic cells (1). In cell culture models differentiation has been reported by exposure of cells to a variety of stimuli, including: cyclic AMP and retinoic acid (2,3), aclarubicin and other anthracyclines (4).

20 There is abundant evidence that neoplastic transformation does not necessarily destroy the potential of cancer cells to differentiate (1,5,6). There are many examples of tumor cells which do not respond to the normal regulators of proliferation and appear to be blocked in the expression of their differentiation program, and yet can be induced to differentiate and cease replicating. A variety of agents, including some relatively simple polar compounds (5,7-9), derivatives of vitamin D and retinoic acid (10-12), steroid hormones (13), growth factors (6,14), proteases (15,16), tumor promoters (17,18), and
25 inhibitors of DNA or RNA synthesis (4,19-24), can induce various transformed cell lines and primary human tumor explants to express more differentiated characteristics.

Early studies identified a series of polar compounds that were effective inducers of differentiation in a number of transformed cell lines (8,9). Of these, the most effective inducer was the hybrid polar/apolar compound N,N'-hexamethylene bisacetamide
30 (HMBA) (9). The use of this polar/apolar compound to induce murine erythroleukemia cells (MELC) to undergo erythroid differentiation with suppression of oncogenicity has proved a useful model to study inducer-mediated differentiation of transformed cells (5,7-

9). HMBA-induced MELC terminal erythroid differentiation is a multi-step process. Upon addition of HMBA to MELC (745A-DS19) in culture, there is a latent period of 10 to 12 hours before commitment to terminal differentiation is detected. Commitment is defined as the capacity of cells to express terminal differentiation despite removal of inducer (25).

5 Upon continued exposure to HMBA there is progressive recruitment of cells to differentiate. The present inventors have reported that MELC cell lines made resistant to relatively low levels of vincristine become markedly more sensitive to the inducing action of HMBA and can be induced to differentiate with little or no latent period (26).

HMBA is capable of inducing phenotypic changes consistent with differentiation
10 in a broad variety of cells lines (5). The characteristics of the drug-induced effect have been most extensively studied in the murine erythroleukemia cell system (MELC) (5,25,27,28). MELC induction of differentiation is both time and concentration dependent. The minimum concentration required to demonstrate an effect in vitro in most strains is 2 to 3 mM; the minimum duration of continuous exposure generally required to induce
15 differentiation in a substantial portion (> 20%) of the population without continuing drug exposure is about 36 hours.

The primary target of action of HMBA is not known. There is evidence that protein kinase C is involved in the pathway of inducer-mediated differentiation (29). The in vitro studies provided a basis for evaluating the potential of HMBA as a cytodifferentiation
20 agent in the treatment of human cancers (30). Several phase I clinical trials with HMBA have been completed (31-36). Clinical trials have shown that this compound can induce a therapeutic response in patients with cancer (35,36). However, these phase I clinical trials also have demonstrated that the potential efficacy of HMBA is limited, in part, by dose-related toxicity which prevents achieving optimal blood levels and by the need for
25 intravenous administration of large quantities of the agent, over prolonged periods.

It has been reported that a number of compounds related to HMBA with polar groups separated by apolar linkages that, on a molar basis, are as active (37) or 100 times more active than HMBA (38). As a class, however, it has been found that the symmetrical dimers such as HMBA and related compounds are not the best cytodifferentiating agents.

30 It has unexpectedly been found that the best compounds comprise two polar end groups separated by a flexible chain of methylene groups, wherein one or both of the polar end groups is a large hydrophobic group. Preferably, the polar end groups are different and

only one is a large hydrophobic group. These compounds are unexpectedly a thousand times more active than HMBA and ten times more active than HMBA related compounds.

Histone deacetylase inhibitors such as suberoylanilide hydroxamide acid (SAHA), belong to this class of agents that have the ability to induce tumor cell growth arrest, differentiation and/or apoptosis (39). These compounds are targeted towards mechanisms inherent to the ability of a neoplastic cell to become malignant, as they do not appear to have toxicity in doses effective for inhibition of tumor growth in animals (40). There are several lines of evidence that histone acetylation and deacetylation are mechanisms by which transcriptional regulation in a cell is achieved (41). These effects are thought to occur through changes in the structure of chromatin by altering the affinity of histone proteins for coiled DNA in the nucleosome. There are five types of histones that have been identified (designated H1, H2A, H2B, H3 and H4). Histones H2A, H2B, H3 and H4 are found in the nucleosomes and H1 is a linker located between nucleosomes. Each nucleosome contains two of each histone type within its core, except for H1, which is present singly in the outer portion of the nucleosome structure. It is believed that when the histone proteins are hypoacetylated, there is a greater affinity of the histone to the DNA phosphate backbone. This affinity causes DNA to be tightly bound to the histone and renders the DNA inaccessible to transcriptional regulatory elements and machinery. The regulation of acetylated states occurs through the balance of activity between two enzyme complexes, histone acetyl transferase (HAT) and histone deacetylase (HDAC). The hypoacetylated state is thought to inhibit transcription of associated DNA. This hypoacetylated state is catalyzed by large multiprotein complexes that include HDAC enzymes. In particular, HDACs have been shown to catalyze the removal of acetyl groups from the chromatin core histones.

The inhibition of HDAC by SAHA is thought occur through direct interaction with the catalytic site of the enzyme as demonstrated by X-ray crystallography studies (42). The result of HDAC inhibition is not believed to have a generalized effect on the genome, but rather, only affects a small subset of the genome (43). Evidence provided by DNA microarrays using malignant cell lines cultured with a HDAC inhibitor shows that there are a finite (1-2%) number of genes whose products are altered. For example, cells treated in culture with HDAC inhibitors show a consistent induction of the cyclin-dependent kinase inhibitor p21 (44). This protein plays an important role in cell cycle arrest. HDAC

inhibitors are thought to increase the rate of transcription of p21 by propagating the hyperacetylated state of histones in the region of the p21 gene, thereby making the gene accessible to transcriptional machinery. Genes whose expression is not affected by HDAC inhibitors do not display changes in the acetylation of regional associated histones (45).

5 It has been shown in several instances that the disruption of HAT or HDAC activity is implicated in the development of a malignant phenotype. For instance, in acute promyelocytic leukemia, the oncoprotein produced by the fusion of PML and RAR alpha appears to suppress specific gene transcription through the recruitment of HDACs (46). In this manner, the neoplastic cell is unable to complete differentiation and leads to excess
10 proliferation of the leukemic cell line.

 U.S. Patent Numbers 5,369,108, 5,932,616, 5,700,811, 6,087,367 and 6,511, 990, issued to some of the present inventors, disclose compounds useful for selectively inducing terminal differentiation of neoplastic cells, which compounds have two polar end groups separated by a flexible chain of methylene groups or a by a rigid phenyl group,
15 wherein one or both of the polar end groups is a large hydrophobic group. Some of the compounds have an additional large hydrophobic group at the same end of the molecule as the first hydrophobic group which further increases differentiation activity about 100 fold in an enzymatic assay and about 50 fold in a cell differentiation assay. Methods of synthesizing the compounds used in the methods and pharmaceutical compositions of this
20 invention are fully described the aforementioned patents, the entire contents of which are incorporated herein by reference.

 In addition to their biological activity as antitumor agents, the compounds disclosed in the aforementioned patents have recently been identified as useful for treating or preventing a wide variety of thioredoxin (TRX)-mediated diseases and conditions, such
25 as inflammatory diseases, allergic diseases, autoimmune diseases, diseases associated with oxidative stress of diseases characterized by celllora hyperproliferation (U.S. Application No. 10/369,094, filed February 15, 2003. Further, these compounds have been identified as useful for treating diseases of the central nervous system (CNS) such as neurodegenerative diseases and for treating brain cancer (See, U.S. Application No.
30 10.273,401, filed October 16, 2002).

 The aforementioned patents do not disclose specific oral formulations of the HDAC inhibitors or specific dosages and dosing schedules of the recited compounds, that

5 There is an urgent need to discover suitable dosages and dosing schedules of these compounds, and to develop formulations, preferably oral formulations, which give rise to steady, therapeutically effective blood levels of the active compounds over an extended period of time, and which are effective at treating cancer.

SUMMARY OF THE INVENTION

In one embodiment, the present invention provides a method of treating leukemia in a subject in need thereof, by administering to the subject a pharmaceutical composition comprising an effective amount of suberoylanilide hydroxamic acid (SAHA) or a pharmaceutically acceptable salt or hydrate thereof, as described herein. SAHA can be administered in a total daily dose of up to 800 mg, preferably orally, once, twice or three times daily, continuously (every day) or intermittently (e.g., 3-5 days a week).

Furthermore, the present invention provides a method of treating leukemia in a subject in need thereof, by administering to the subject a pharmaceutical composition comprising an effective amount of an HDAC inhibitor as described herein, or a

pharmaceutically acceptable salt or hydrate thereof. In one embodiment, the HDAC inhibitor is a hydroxamic acid derivative HDAC inhibitor. The HDAC inhibitor can be administered in a total daily dose of up to 800 mg, preferably orally, once, twice or three times daily, continuously (i.e., every day) or intermittently (e.g., 3-5 days a week).

5 The HDAC inhibitors and methods of the present invention are useful in the treatment of a wide variety of cancers, including acute and chronic leukemias.

 In one embodiment, the HDAC inhibitors of the present invention are useful in the treatment of Acute Myeloid Leukemia (AML), including undifferentiated AML, myeloblastic leukemia with minimal maturation, promyelocytic leukemia,
10 myelomonocytic leukemia, myelomonocytic leukemia with eosinophilia, monocytic leukemia, erythroid leukemia, and megakaryoblastic leukemia, classified by the French-American-British (FAB) classification as M0-M7, respectively.

 In another embodiment, the HDAC inhibitors of the present invention are useful in the treatment of Acute Lymphocytic Leukemia (ALL), including ALL subtype L1, L2 and
15 L3 (Burkitt's type leukemia) as classified by the FAB classification.

 In another embodiment, the HDAC inhibitors of the present invention are useful in the treatment of Chronic Myeloid Leukemia (CML).

 In another embodiment, the HDAC inhibitors of the present invention are useful in the treatment of Chronic Lymphocytic Leukemia (CLL).

20 In another embodiment, the HDAC inhibitors of the present invention are useful in the treatment of Hairy Cell Leukemia..

 HDAC inhibitors suitable for use in the present invention, include but are not limited to hydroxamic acid derivatives, Short Chain Fatty Acids (SCFAs), cyclic tetrapeptides, benzamide derivatives, or electrophilic ketone derivatives, as defined herein.

25 Specific non-limiting examples of HDAC inhibitors suitable for use in the methods of the present invention are:

 A) **Hydroxamic acid derivatives** selected from m-carboxycinnamic acid bishydroxamide (CBHA), Trichostatin A (TSA), Trichostatin C, Salicylhydroxamic Acid, Azelaic Bishydroxamic Acid (ABHA), Azelaic-1-
30 Hydroxamate-9-Anilide (AAHA), 6-(3-Chlorophenylureido) carpoic Hydroxamic Acid (3Cl-UCHA), Oxamflatin, A-161906, Scriptaid, PXD-101, LAQ-824, CHAP, MW2796, and MW2996;

- B) **Cyclic tetrapeptides** selected from Trapoxin A, FR901228 (FK 228 or Depsipeptide), FR225497, Apicidin, CHAP, HC-Toxin, WF27082, and Chlamydocin;
- 5 C) **Short Chain Fatty Acids (SCFAs)** selected from Sodium Butyrate, Isovalerate, Valerate, 4 Phenylbutyrate (4-PBA), Phenylbutyrate (PB), Propionate, Butyramide, Isobutyramide, Phenylacetate, 3-Bromopropionate, Tributyrin, Valproic Acid and Valproate;
- 10 D) **Benzamide Derivatives** selected from CI-994, MS-27-275 (MS-275) and a 3'-amino derivative of MS-27-275;
- E) **Electrophilic Ketone Derivatives** selected from a trifluoromethyl ketone and an α -keto amide such as an N-methyl- α -ketoamide; and
- F) **Miscellaneous HDAC inhibitors** including natural products, psammaplins and Depudecin.

15

Specific HDAC inhibitors include:

Suberoylanilide hydroxamic acid (SAHA), which is represented by the following structural formula:

20

Pyroxamide, which is represented by the following structural formula:

25 m-Carboxycinnamic acid bishydroxamide (CBHA), which is represented by the structural formula:

Other non-limiting examples of HDAC inhibitors that are suitable for use in the methods of the present invention are:

5 A compound represented by the structure:

10 wherein R₃ and R₄ are independently a substituted or unsubstituted, branched or unbranched alkyl, alkenyl, cycloalkyl, aryl, alkyloxy, aryloxy, arylalkyloxy, or pyridine group, cycloalkyl, aryl, aryloxy, arylalkyloxy, or pyridine group, or R₃ and R₄ bond together to form a piperidine group; R₂ is a hydroxylamino group; and n is an integer from 5 to 8.

15 A compound represented by the structure:

20 wherein R is a substituted or unsubstituted phenyl, piperidine, thiazole, 2-pyridine, 3- pyridine or 4-pyridine and n is an integer from 4 to 8.

A compound represented by the structure:

wherein A is an amide moiety, R₁ and R₂ are each selected from substituted or unsubstituted aryl, arylalkyl, naphthyl, pyridineamino, 9-purine-6-amino, thiazoleamino, aryloxy, arylalkyloxy, pyridyl, quinolinylnyl or isoquinolinylnyl; R₄ is hydrogen, a halogen, a phenyl or a cycloalkyl moiety and n is an integer from 3 to 10.

In one embodiment, the pharmaceutical compositions comprising the HDAC inhibitor are administered orally, for example within a gelatin capsule. In a further embodiment, the pharmaceutical compositions are further comprised of microcrystalline cellulose, croscarmellose sodium and magnesium stearate.

The HDAC inhibitors can be administered in a total daily dose which may vary from patient to patient, and may be administered at varying dosage schedules. Suitable dosages are total daily dosage of between about 25-4000 mg/m² administered orally once-daily, twice-daily or three times-daily, continuous (every day) or intermittently (e.g., 3-5 days a week). Furthermore, the compositions may be administered in cycles, with rest periods in between the cycles (e.g., treatment for two to eight weeks with a rest period of up to a week between treatments).

In one embodiment, the composition is administered once daily at a dose of about 200-600 mg. In another embodiment, the composition is administered twice daily at a dose of about 200-400 mg. In another embodiment, the composition is administered twice daily at a dose of about 200-400 mg intermittently, for example three, four or five days per week. In another embodiment, the compositions is administered three times daily at a dose of about 100-250 mg.

In one embodiment, the daily dose is 200 mg which can be administered once-daily, twice-daily or three-times daily. In one embodiment, the daily dose is 300 mg which can be administered once-daily, twice-daily or three-times daily. In one embodiment, the daily dose is 400 mg which can be administered once-daily, twice-daily or three-times daily. In one embodiment, the daily dose is 150 mg which can be administered twice-daily or three-times daily.

The present invention also provides methods for selectively inducing terminal differentiation, cell growth arrest and/or apoptosis of neoplastic cells, e.g., leukemia cells in a subject, thereby inhibiting proliferation of such cells in said subject, by administering to the subject a pharmaceutical composition comprising an effective amount of an HDAC

inhibitor, e.g., SAHA, or a pharmaceutically acceptable salt or hydrate thereof, and a pharmaceutically acceptable carrier or diluent. An effective amount of an HDAC inhibitor in the present invention can be up to a total daily dose of 800 mg.

The present invention also provides methods for inhibiting the activity of a histone deacetylase in a subject, by administering to the subject a pharmaceutical composition comprising an effective amount of an HDAC inhibitor, e.g., SAHA, or a pharmaceutically acceptable salt or hydrate thereof, and a pharmaceutically acceptable carrier or diluent. An effective amount of an HDAC inhibitor in the present invention can be up to a total daily dose of 800 mg.

The present invention also provides *in-vitro* methods for selectively inducing terminal differentiation, cell growth arrest and/or apoptosis of neoplastic cells, e.g., leukemia cells, thereby inhibiting proliferation of such cells, by contacting the cells with an effective amount of a an HDAC inhibitor, e.g., SAHA, or a pharmaceutically acceptable salt or hydrate thereof.

The present invention also provides *in-vitro* methods for inhibiting the activity of a histone deacetylase, by the histone deacetylase with an effective amount of an HDAC inhibitor, e.g., SAHA, or a pharmaceutically acceptable salt or hydrate thereof.

The present invention further provides a safe, daily dosing regimen of the formulation of pharmaceutical compositions comprising an HDAC inhibitor which are easy to follow and to adhere to. These pharmaceutical compositions are suitable for oral administration and are useful for treating cancer, e.g., leukemia, selectively inducing terminal differentiation, cell growth arrest and/or apoptosis of neoplastic cells, and/or which for inhibiting histone deacetylase (HDAC).

BRIEF DESCRIPTION OF THE DRAWINGS

The foregoing and other objects, features and advantages of the invention will be apparent from the following more particular description of preferred embodiments of the invention, as illustrated in the accompanying drawings in which like reference characters refer to the same parts throughout the different views. The drawings are not necessarily to scale, emphasis instead being placed upon illustrating the principles of the invention.

FIG. 1 is a picture of a Western blot (top panel) showing the quantities of

acetylated histone-4 (α -AcH4) in the blood plasma of patients following an oral or intravenous (IV) dose of SAHA. IV SAHA was administered at 200 mg infused over two hours. Oral SAHA was administered in a single capsule at 200 mg. The amount of α -AcH4 is shown at the indicated time points. Bottom panel: Coomassie blue stain.

5

FIG. 2 is a picture of a Western blot (top panels) showing the quantities of acetylated histone-4 (α -AcH4) in the blood plasma of patients having a solid tumor, following an oral or intravenous (IV) dose of SAHA. IV and Oral SAHA were administered as in Figure 1. The amount of α -AcH4 is shown at the indicated time points. The experiment is shown in duplicate (Fig 2A and Fig 2B). Bottom panels: Coomassie blue stain.

10

FIG. 3 is a picture of a Western blot (top panels) showing the quantities of acetylated histone-4 (α -AcH4) (Figure 3A) and acetylated histone-3 (α -AcH3) (Figures 3B-E) in the blood plasma of patients following an oral or intravenous (IV) dose of SAHA, on Day 1 and Day 21. IV and Oral SAHA were administered as in Figure 1. The amount of α -AcH4 or α -AcH3 is shown at the indicated time points. Bottom panels: Coomassie blue stain.

15

FIG. 4 is a picture of a Western blot (top panels) showing the quantities of acetylated histone-3 (α -AcH3) in the blood plasma of patients having a solid tumor, following an oral or intravenous (IV) dose of SAHA. IV and Oral SAHA were administered as in Figure 1. The amount of α -AcH3 is shown at the indicated time points. Bottom panel: Coomassie blue stain.

20

FIG. 5 is a picture of a Western blot (top panels) showing the quantities of acetylated histone-3 (α -AcH3) in the blood plasma of patients following an oral or intravenous (IV) dose of SAHA. IV SAHA was administered at 400 mg infused over two hours. Oral SAHA was administered in a single capsule at 400 mg. The amount of α -AcH4 is shown at the indicated time points. The experiment is shown in triplicate (Fig 5A and B). Bottom panels: Coomassie blue stain.

25

FIG. 6 is a picture of a Western blot (top panel) showing the quantities of acetylated histone-3 (α -AcH3) in the blood plasma of patients having a solid tumor, following an oral or intravenous (IV) dose of SAHA. IV and

30

Oral SAHA were administered as in Figure 5. The amount of α -AcH3 is shown at the indicated time points. Bottom panel: Coomassie blue stain.

5 **FIG. 7** is a picture of a Western blot (top panels) showing the quantities of acetylated histone-3 (α -AcH3) in the blood plasma of patients having a solid tumor following an oral or intravenous (IV) dose of SAHA, on Day 1 and Day 21. IV and Oral SAHA were administered as in Figure 4. The amount of α -AcH4 or α -AcH3 is shown at the indicated time points. The experiment is shown in triplicate (Fig 7 A-C). Bottom panels: Coomassie blue stain.

10 **FIG. 8** is a picture of a Western blot (top panels) showing the quantities of acetylated histone-3 (α -AcH3) in the blood plasma of patients following an oral or intravenous (IV) dose of SAHA. IV and Oral SAHA were administered as in Figure 5. The amount of α -AcH3 is shown at the indicated time points. Bottom panels: Coomassie blue stain.

15 **FIGS. 9A-C** are graphs showing the mean plasma concentration of SAHA (ng/ml) at the indicated time points following administration. Fig 9A: Oral dose (200 mg and 400 mg) under fasting on Day 8. Fig 9B: Oral dose (200 mg and 400 mg) with food on Day 9. Fig 9C: IV dose on day 1.

FIG. 10 shows the apparent half-life of a SAHA 200 mg and 400 mg oral dose, on
20 Days 8, 9 and 22.

FIG. 11 shows the AUC (ng/ml/hr) of a SAHA 200 mg and 400 mg oral dose, on Days 8, 9 and 22.

FIG. 12 shows the bioavailability of SAHA after a 200 mg and 400 mg oral dose,
25 on Days 8, 9 and 22.

DETAILED DESCRIPTION OF THE INVENTION

The present invention relates to methods of treating acute and chronic leukemias including Acute Lymphocytic Leukemia (ALL), Acute Myeloid Leukemia (AML), Chronic Lymphocytic leukemia (CLL), Chronic myeloid leukemia (CML) and Hairy Cell
30 Leukemia, by administration of pharmaceutical compositions comprising HDAC inhibitors, e.g., suberoylanilide hydroxamic acid (SAHA). The oral formulations of the pharmaceutical compositions have favorable pharmacokinetic profiles such as high

bioavailability and surprisingly give rise to high blood levels of the active compounds over an extended period of time. The present invention further provides a safe, daily dosing regimen of these pharmaceutical compositions, which is easy to follow, and which results in a therapeutically effective amount of the HDAC inhibitors *in vivo*.

5 Accordingly, in one embodiment, the present invention provides a method of treating leukemia in a subject in need thereof, by administering to the subject a pharmaceutical composition comprising an effective amount of an HDAC inhibitor as described herein, or a pharmaceutically acceptable salt or hydrate thereof. The HDAC inhibitor can be administered in a total daily dose of up to 800 mg, preferably orally, once,
10 twice or three times daily, continuously (i.e., every day) or intermittently (e.g., 3-5 days a week).

 In one embodiment, the HDAC inhibitor is suberoylanilide hydroxamic acid (SAHA). In another embodiment, the HDAC inhibitor is a hydroxamic acid derivative as described herein. In another embodiment, the HDAC inhibitor is represented by any of
15 the structure of formulas 1-51 described herein. In another embodiment, the HDAC inhibitor is a benzamide derivative as described herein. In another embodiment, the HDAC inhibitor is a cyclic tetrapeptide as described herein. In another embodiment, the HDAC inhibitor is a Short Chain Fatty Acid (SCFA) as described herein. In another embodiment, the HDAC inhibitor is an electrophilic ketone as described herein. In
20 another embodiment, the HDAC inhibitor is depudecin. In another embodiment, the HDAC inhibitor is a natural product. In another embodiment, the HDAC inhibitor is a psammaphin.

 In one particular embodiment, the present invention provides a method of treating leukemia in a subject in need thereof, by administering to the subject a pharmaceutical
25 composition comprising an effective amount of suberoylanilide hydroxamic acid (SAHA) or a pharmaceutically acceptable salt or hydrate thereof, as described herein. SAHA can be administered in a total daily dose of up to 800 mg, preferably orally, once, twice or three times daily, continuously (every day) or intermittently (e.g., 3-5 days a week). SAHA is represented by the following structure:

30

In another particular embodiment, the present invention relates to a method of treating leukemia in a subject, comprising the step of administering to the subject an effective amount of a pharmaceutical composition comprising a histone deacetylase (HDAC) inhibitor represented by any of the structure described herein as by formulas 1-51 described herein, or a pharmaceutically acceptable salt or hydrate thereof, and a pharmaceutically acceptable carrier or diluent, wherein the amount of the histone deacetylase inhibitor is effective to treat leukemia in the subject.

The term "treating" in its various grammatical forms in relation to the present invention refers to preventing (i.e., chemoprevention), curing, reversing, attenuating, alleviating, minimizing, suppressing or halting the deleterious effects of a disease state, disease progression, disease causative agent (e.g., bacteria or viruses) or other abnormal condition. For example, treatment may involve alleviating a symptom (i.e., not necessary all symptoms) of a disease or attenuating the progression of a disease. Because some of the inventive methods involve the physical removal of the etiological agent, the artisan will recognize that they are equally effective in situations where the inventive compound is administered prior to, or simultaneous with, exposure to the etiological agent (prophylactic treatment) and situations where the inventive compounds are administered after (even well after) exposure to the etiological agent.

Treatment of cancer, as used herein, refers to partially or totally inhibiting, delaying or preventing the progression of cancer including cancer metastasis; inhibiting, delaying or preventing the recurrence of cancer including cancer metastasis; or preventing the onset or development of cancer (chemoprevention) in a mammal, for example a human.

As used herein, the term "therapeutically effective amount" is intended to encompass any amount that will achieve the desired biological response. In the present invention, the desired biological response is partial or total inhibition, delay or prevention of the progression of cancer including cancer metastasis; inhibition, delay or prevention of

the recurrence of cancer including cancer metastasis; or the prevention of the onset or development of cancer (chemoprevention) in a mammal, for example a human.

The method of the present invention is intended for the treatment or chemoprevention of human patients with cancer. However, it is also likely that the method
5 would be effective in the treatment of cancer in other mammals.

Histone Deacetylases and Histone Deacetylase Inhibitors

Histone deacetylases (HDACs), as that term is used herein, are enzymes that catalyze the removal of acetyl groups from lysine residues in the amino terminal tails of
10 the nucleosomal core histones. As such, HDACs together with histone acetyl transferases (HATs) regulate the acetylation status of histones. Histone acetylation affects gene expression and inhibitors of HDACs, such as the hydroxamic acid-based hybrid polar compound suberoylanilide hydroxamic acid (SAHA) induce growth arrest, differentiation and/or apoptosis of transformed cells *in vitro* and inhibit tumor growth *in vivo*. HDACs
15 can be divided into three classes based on structural homology. Class I HDACs (HDACs 1, 2, 3 and 8) bear similarity to the yeast RPD3 protein, are located in the nucleus and are found in complexes associated with transcriptional co-repressors. Class II HDACs (HDACs 4, 5, 6, 7 and 9) are similar to the yeast HDA1 protein, and have both nuclear and cytoplasmic subcellular localization. Both Class I and II HDACs are inhibited by
20 hydroxamic acid-based HDAC inhibitors, such as SAHA. Class III HDACs form a structurally distant class of NAD dependent enzymes that are related to the yeast SIR2 proteins and are not inhibited by hydroxamic acid-based HDAC inhibitors.

Histone deacetylase inhibitors or HDAC inhibitors, as that term is used herein are compounds that are capable of inhibiting the deacetylation of histones *in vivo*, *in vitro* or
25 both. As such, HDAC inhibitors inhibit the activity of at least one histone deacetylase. As a result of inhibiting the deacetylation of at least one histone, an increase in acetylated histone occurs and accumulation of acetylated histone is a suitable biological marker for assessing the activity of HDAC inhibitors. Therefore, procedures that can assay for the accumulation of acetylated histones can be used to determine the HDAC inhibitory
30 activity of compounds of interest. It is understood that compounds that can inhibit histone deacetylase activity can also bind to other substrates and as such can inhibit other biologically active molecules such as enzymes. It is also to be understood that the

compounds of the present invention are capable of inhibiting any of the histone deacetylases set forth above, or any other histone deacetylases.

For example, in patients receiving HDAC inhibitors, the accumulation of acetylated histones in peripheral mononuclear cells as well as in tissue treated with HDAC inhibitors can be determined against a suitable control.

HDAC inhibitory activity of a particular compound can be determined *in vitro* using, for example, an enzymatic assays which shows inhibition of at least one histone deacetylase. Further, determination of the accumulation of acetylated histones in cells treated with a particular composition can be determinative of the HDAC inhibitory activity of a compound.

Assays for the accumulation of acetylated histones are well known in the literature. See, for example, Marks, P.A. *et al.*, J. Natl. Cancer Inst., 92:1210-1215, 2000, Butler, L.M. *et al.*, Cancer Res. 60:5165-5170 (2000), Richon, V. M. *et al.*, Proc. Natl. Acad. Sci., USA, 95:3003-3007, 1998, and Yoshida, M. *et al.*, J. Biol. Chem., 265:17174-17179, 1990.

For example, an enzymatic assay to determine the activity of an HDAC inhibitor compound can be conducted as follows. Briefly, the effect of an HDAC inhibitor compound on affinity purified human epitope-tagged (Flag) HDAC1 can be assayed by incubating the enzyme preparation in the absence of substrate on ice for about 20 minutes with the indicated amount of inhibitor compound. Substrate ($[^3\text{H}]$ acetyl-labelled murine erythroleukemia cell-derived histone) can be added and the sample can be incubated for 20 minutes at 37°C in a total volume of 30 μL . The reaction can then be stopped and released acetate can be extracted and the amount of radioactivity release determined by scintillation counting. An alternative assay useful for determining the activity of an HDAC inhibitor compound is the "HDAC Fluorescent Activity Assay; Drug Discovery Kit-AK-500" available from BIOMOL Research Laboratories, Inc., Plymouth Meeting, PA.

In vivo studies can be conducted as follows. Animals, for example, mice, can be injected intraperitoneally with an HDAC inhibitor compound. Selected tissues, for example, brain, spleen, liver etc, can be isolated at predetermined times, post administration. Histones can be isolated from tissues essentially as described by Yoshida *et al.*, J. Biol. Chem. 265:17174-17179, 1990. Equal amounts of histones (about 1 μg) can be electrophoresed on 15% SDS-polyacrylamide gels and can be transferred to Hybond-P

filters (available from Amersham). Filters can be blocked with 3% milk and can be probed with a rabbit purified polyclonal anti-acetylated histone H4 antibody (α Ac-H4) and anti-acetylated histone H3 antibody (α Ac-H3) (Upstate Biotechnology, Inc.). Levels of acetylated histone can be visualized using a horseradish peroxidase-conjugated goat anti-rabbit antibody (1:5000) and the SuperSignal chemiluminescent substrate (Pierce). As a loading control for the histone protein, parallel gels can be run and stained with Coomassie Blue (CB).

In addition, hydroxamic acid-based HDAC inhibitors have been shown to up regulate the expression of the p21^{waf1} gene. The p21^{waf1} protein is induced within 2 hours of culture with HDAC inhibitors in a variety of transformed cells using standard methods. The induction of the p21^{waf1} gene is associated with accumulation of acetylated histones in the chromatin region of this gene. Induction of p21^{waf1} can therefore be recognized as involved in the G1 cell cycle arrest caused by HDAC inhibitors in transformed cells.

Typically, HDAC inhibitors fall into five general classes: 1) hydroxamic acid derivatives; 2) Short-Chain Fatty Acids (SCFAs); 3) cyclic tetrapeptides; 4) benzamides; and 5) electrophilic ketones.

Thus, the present invention includes within its broad scope compositions comprising HDAC inhibitors which are 1) hydroxamic acid derivatives; 2) Short-Chain Fatty Acids (SCFAs); 3) cyclic tetrapeptides; 4) benzamides; 5) electrophilic ketones; and/or any other class of compounds capable of inhibiting histone deacetylases, for use in inhibiting histone deacetylase, inducing terminal differentiation, cell growth arrest and/or apoptosis in neoplastic cells, and/or inducing differentiation, cell growth arrest and/or apoptosis of tumor cells in a tumor.

Non-limiting examples of such HDAC inhibitors are set forth below. It is understood that the present invention includes any salts, crystal structures, amorphous structures, hydrates, derivatives, metabolites, stereoisomers, structural isomers, polymorphs and prodrugs of the HDAC inhibitors described herein.

A. **Hydroxamic Acid Derivatives** such as suberoylanilide hydroxamic acid (SAHA) (Richon *et al.*, Proc. Natl. Acad. Sci. USA 95,3003-3007 (1998)); m-carboxycinnamic acid bishydroxamide (CBHA) (Richon *et al.*, *supra*); pyroxamide; trichostatin analogues such as trichostatin A (TSA) and trichostatin C (Koghe *et al.* 1998. Biochem. Pharmacol.

56: 1359-1364); salicylhydroxamic acid (Andrews *et al.*, International J. Parasitology 30,761-768 (2000)); suberoyl bishydroxamic acid (SBHA) (U.S. Patent No. 5,608,108); azelaic bishydroxamic acid (ABHA) (Andrews *et al.*, supra); azelaic-1-hydroxamate-9-anilide (AAHA) (Qiu *et al.*, Mol. Biol. Cell 11, 2069-2083 (2000)); 6-(3-chlorophenylureido) carpoic hydroxamic acid (3Cl-UCHA); oxamflatin [(2E)-5-[3-
5 [(phenylsulfonyl) aminol phenyl]-pent-2-en-4-ynohydroxamic acid] (Kim *et al.* Oncogene, 18: 2461 2470 (1999)); A-161906, Scriptaid (Su *et al.* 2000 Cancer Research, 60: 3137-3142); PXD-101 (Prolifix); LAQ-824; CHAP; MW2796 (Andrews *et al.*, supra); MW2996 (Andrews *et al.*, supra); or any of the hydroxamic acids disclosed in U.S. Patent
10 Numbers 5,369,108, 5,932,616, 5,700,811, 6,087,367 and 6,511, 990.

B. Cyclic Tetrapeptides such as trapoxin A (TPX)-cyclic tetrapeptide (cyclo-(L-phenylalanyl-L-phenylalanyl-D-pipecolinyl-L-2-amino-8-oxo-9,10-epoxy decanoyl)) (Kijima *et al.*, J Biol. Chem. 268,22429-22435 (1993)); FR901228 (FK 228, depsipeptide)
15 (Nakajima *et al.*, Ex. Cell Res. 241,126-133 (1998)); FR225497 cyclic tetrapeptide (H. Mori *et al.*, PCT Application WO 00/08048 (17 February 2000)); apicidin cyclic tetrapeptide [cyclo(N-O-methyl-L-tryptophanyl-L -isoleucinyl-D-pipecolinyl-L-2-amino-8-oxodecanoyl)] (Darkin-Rattray *et al.*, Proc. Natl. Acad. Sci. USA 93,1314313147 (1996)); apicidin Ia, apicidin Ib, apicidin Ic, apicidin IIa, and apicidin IIb (P. Dulski *et al.*,
20 PCT Application WO 97/11366); CHAP, HC-toxin cyclic tetrapeptide (Bosch *et al.*, Plant Cell 7, 1941-1950 (1995)); WF27082 cyclic tetrapeptide (PCT Application WO 98/48825); and chlamydocin (Bosch *et al.*, supra).

C. Short chain fatty acid (SCFA) derivatives such as: sodium
25 butyrate (Cousens *et al.*, J. Biol. Chem. 254,1716-1723 (1979)); isovalerate (McBain *et al.*, Biochem. Pharm. 53: 1357-1368 (1997)); valerate (McBain *et al.*, supra) ; 4-phenylbutyrate (4-PBA) (Lea and Tulsyan, Anticancer Research, 15,879-873 (1995)); phenylbutyrate (PB) (Wang *et al.*, Cancer Research, 59, 2766-2799 (1999)); propionate (McBain *et al.*, supra); butyramide (Lea and Tulsyan, supra); isobutyramide (Lea and
30 Tulsyan, supra); phenylacetate (Lea and Tulsyan, supra); 3-bromopropionate (Lea and Tulsyan, supra); tributyrin (Guan *et al.*, Cancer Research, 60,749-755 (2000)); valproic acid, valproate and PivanexTM.

D. **Benzamide derivatives** such as CI-994; MS-275 [N- (2-aminophenyl)-4- [N- (pyridin-3-yl methoxycarbonyl) aminomethyl] benzamide] (Saito *et al.*, Proc. Natl. Acad. Sci. USA 96, 4592-4597 (1999)); and 3'-amino derivative of MS-275 (Saito *et al.*, *supra*).

5

E. **Electrophilic ketone derivatives** such as trifluoromethyl ketones (Frey *et al.*, Bioorganic & Med. Chem. Lett. (2002), 12, 3443-3447; U.S. 6,511,990) and α -keto amides such as N-methyl- α -ketoamides

10 F. **Other HDAC Inhibitors** such as natural products, psammaplins and depudecin (Kwon *et al.* 1998. PNAS 95: 3356-3361).

Preferred hydroxamic acid based HDAC inhibitors are suberoylanilide hydroxamic acid (SAHA), m-carboxycinnamic acid bishydroxamide (CBHA) and pyroxamide. SAHA
15 has been shown to bind directly in the catalytic pocket of the histone deacetylase enzyme. SAHA induces cell cycle arrest, differentiation and/or apoptosis of transformed cells in culture and inhibits tumor growth in rodents. SAHA is effective at inducing these effects in both solid tumors and hematological cancers. It has been shown that SAHA is effective at inhibiting tumor growth in animals with no toxicity to the animal. The SAHA-induced
20 inhibition of tumor growth is associated with an accumulation of acetylated histones in the tumor. SAHA is effective at inhibiting the development and continued growth of carcinogen-induced (N-methylnitrosourea) mammary tumors in rats. SAHA was administered to the rats in their diet over the 130 days of the study. Thus, SAHA is a nontoxic, orally active antitumor agent whose mechanism of action involves the inhibition
25 of histone deacetylase activity.

Preferred HDAC inhibitors are those disclosed in U.S. Patent Numbers 5,369,108, 5,932,616, 5,700,811, 6,087,367 and 6,511, 990, issued to some of the present inventors disclose compounds, the entire contents of which are incorporated herein by reference, non-limiting examples of which are set forth below:

30 In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 1, or a pharmaceutically acceptable salt or hydrate thereof:

(1)

wherein R₁ and R₂ can be the same or different; when R₁ and R₂ are the same, each is a substituted or unsubstituted arylamino, cycloalkylamino, pyridineamino, piperidino, 9-purine-6-amine or thiazoleamino group; when R₁ and R₂ are different R₁=R₃-N-R₄, wherein each of R₃ and R₄ are independently the same as or different from each other and are a hydrogen atom, a hydroxyl group, a substituted or unsubstituted, branched or unbranched alkyl, alkenyl, cycloalkyl, aryl alkyloxy, aryloxy, arylalkyloxy or pyridine group, or R₃ and R₄ are bonded together to form a piperidine group, R₂ is a hydroxylamino, hydroxyl, amino, alkylamino, dialkylamino or alkyloxy group and n is an integer from about 4 to about 8.

In a particular embodiment of formula 1, R₁ and R₂ are the same and are a substituted or unsubstituted thiazoleamino group; and n is an integer from about 4 to about 8.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 2, or a pharmaceutically acceptable salt or hydrate thereof:

(2)

wherein each of R₃ and R₄ are independently the same as or different from each other and are a hydrogen atom, a hydroxyl group, a substituted or unsubstituted, branched or unbranched alkyl, alkenyl, cycloalkyl, arylalkyloxy, aryloxy, arylalkyloxy or pyridine group, or R₃ and R₄ are bonded together to form a piperidine group, R₂ is a hydroxylamino, hydroxyl, amino, alkylamino, dialkylamino or alkyloxy group and n is an integer from about 4 to about 8.

In a particular embodiment of formula 2, each of R₃ and R₄ are independently the same as or different from each other and are a hydrogen atom, a hydroxyl group, a substituted or unsubstituted, branched or unbranched alkyl, alkenyl, cycloalkyl, aryl,

alkyloxy, aryloxy, arylalkyloxy, or pyridine group, or R_3 and R_4 bond together to form a piperidine group; R_2 is a hydroxylamino, hydroxyl, amino, alkylamino, or alkyloxy group; n is an integer from 5 to 7; and R_3 -N- R_4 and R_2 are different.

In another particular embodiment of formula 2, n is 6. In yet another embodiment of formula 2, R_4 is a hydrogen atom, R_3 is a substituted or unsubstituted phenyl and n is 6. In yet another embodiment of formula 2, R_4 is a hydrogen atom, R_3 is a substituted phenyl and n is 6, wherein the phenyl substituent is selected from the group consisting of a methyl, cyano, nitro, trifluoromethyl, amino, aminocarbonyl, methylcyano, chloro, fluoro, bromo, iodo, 2,3-difluoro, 2,4-difluoro, 2,5-difluoro, 3,4-difluoro, 3,5-difluoro, 2,6-difluoro, 1,2,3-trifluoro, 2,3,6-trifluoro, 2,4,6-trifluoro, 3,4,5-trifluoro, 2,3,5,6-tetrafluoro, 2,3,4,5,6-pentafluoro, azido, hexyl, t-butyl, phenyl, carboxyl, hydroxyl, methoxy, phenyloxy, benzyloxy, phenylaminooxy, phenylaminocarbonyl, methoxycarbonyl, methylaminocarbonyl, dimethylamino, dimethylamino carbonyl, or hydroxylaminocarbonyl group.

In another embodiment of formula 2, n is 6, R_4 is a hydrogen atom and R_3 is a cyclohexyl group. In another embodiment of formula 2, n is 6, R_4 is a hydrogen atom and R_3 is a methoxy group. In another embodiment of formula 2, n is 6 and R_3 and R_4 bond together to form a piperidine group. In another embodiment of formula 2, n is 6, R_4 is a hydrogen atom and R_3 is a benzyloxy group. In another embodiment of formula 2, R_4 is a hydrogen atom and R_3 is a γ -pyridine group. In another embodiment of formula 2, R_4 is a hydrogen atom and R_3 is a β -pyridine group. In another embodiment of formula 2, R_4 is a hydrogen atom and R_3 is an α -pyridine group. In another embodiment of formula 2, n is 6, and R_3 and R_4 are both methyl groups. In another embodiment of formula 2, n is 6, R_4 is a methyl group and R_3 is a phenyl group.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 3, or a pharmaceutically acceptable salt or hydrate thereof:

wherein n is an integer from 5 to about 8.

In a preferred embodiment of formula 3, n is 6. In accordance with this embodiment, the HDAC inhibitor is SAHA (4), or a pharmaceutically acceptable salt or hydrate thereof:

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 5, or a pharmaceutically acceptable salt or hydrate thereof:

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 6 (pyroxamide), or a pharmaceutically acceptable salt or hydrate thereof:

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 7, or a pharmaceutically acceptable salt or hydrate thereof:

(7)

5

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 8, or a pharmaceutically acceptable salt or hydrate thereof:

10

(8)

15

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 9, or a pharmaceutically acceptable salt or hydrate thereof:

20

(9)

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 10, or a pharmaceutically acceptable salt or hydrate thereof:

25

wherein R₃ is hydrogen and R₄ cycloalkyl, aryl, aryloxy, arylalkyloxy, or pyridine group,
5 or R₃ and R₄ bond together to form a piperidine group; R₂ is a hydroxylamino group; and n is an integer from 5 to about 8.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 11, or a pharmaceutically acceptable salt or hydrate thereof:

10

wherein R₃ and R₄ are independently a substituted or unsubstituted, branched or
15 unbranched alkyl, alkenyl, cycloalkyl, aryl, alkyloxy, aryloxy, arylalkyloxy, or pyridine group, cycloalkyl, aryl, aryloxy, arylalkyloxy, or pyridine group, or R₃ and R₄ bond together to form a piperidine group; R₂ is a hydroxylamino group; and n is an integer from 5 to about 8.

In one embodiment, the HDAC inhibitor useful in the methods of the present
20 invention is represented by the structure of formula 12, or a pharmaceutically acceptable salt or hydrate thereof:

25 wherein each of X and Y are independently the same as or different from each other and are a hydroxyl, amino or hydroxylamino group, a substituted or unsubstituted alkyloxy,

alkylamino, dialkylamino, arylamino, alkylarylamino, alkyloxyamino, aryloxyamino, alkyloxyalkylamino, or aryloxyalkylamino group; R is a hydrogen atom, a hydroxyl group, a substituted or unsubstituted alkyl, arylalkyloxy, or aryloxy group; and each of m and n are independently the same as or different from each other and are each an integer from about 0 to about 8.

In a particular embodiment, the HDAC inhibitor is a compound of formula 12 wherein X, Y and R are each hydroxyl and both m and n are 5.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 13, or a pharmaceutically acceptable salt or hydrate thereof:

wherein each of X and Y are independently the same as or different from each other and are a hydroxyl, amino or hydroxylamino group, a substituted or unsubstituted alkyloxy, alkylamino, dialkylamino, arylamino, alkylarylamino, alkyloxyamino, aryloxyamino, alkyloxyalkylamino or aryloxyalkylamino group; each of R₁ and R₂ are independently the same as or different from each other and are a hydrogen atom, a hydroxyl group, a substituted or unsubstituted alkyl, aryl, alkyloxy, or aryloxy group; and each of m, n and o are independently the same as or different from each other and are each an integer from about 0 to about 8.

In one particular embodiment of formula 13, each of X and Y is a hydroxyl group and each of R₁ and R₂ is a methyl group. In another particular embodiment of formula 13, each of X and Y is a hydroxyl group, each of R₁ and R₂ is a methyl group, each of n and o is 6, and m is 2.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 14, or a pharmaceutically acceptable salt or hydrate thereof:

wherein each of X and Y are independently the same as or different from each other and are a hydroxyl, amino or hydroxylamino group, a substituted or unsubstituted alkyloxy, alkylamino, dialkylamino, arylamino, alkylaryl amino, alkyloxyamino, aryloxyamino, alkyloxyalkylamino or aryloxyalkylamino group; each of R₁ and R₂ are independently the same as or different from each other and are a hydrogen atom, a hydroxyl group, a substituted or unsubstituted alkyl, aryl, alkyloxy, or aryloxy group; and each of m and n are independently the same as or different from each other and are each an integer from about 0 to about 8.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 15, or a pharmaceutically acceptable salt or hydrate thereof:

wherein each of X and Y are independently the same as or different from each other and are a hydroxyl, amino or hydroxylamino group, a substituted or unsubstituted alkyloxy, alkylamino, dialkylamino, arylamino, alkylaryl amino, alkyloxyamino, aryloxyamino, alkyloxyalkylamino or aryloxyalkylamino group; and each of m and n are independently the same as or different from each other and are each an integer from about 0 to about 8.

In one particular embodiment of formula 15, each of X and Y is a hydroxyl group and each of m and n is 5.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 16, or a pharmaceutically acceptable salt or hydrate thereof:

wherein each of X and Y are independently the same as or different from each other and
5 are a hydroxyl, amino or hydroxylamino group, a substituted or unsubstituted alkyloxy,
alkylamino, dialkylamino, arylamino, alkylarylamino, alkyloxyamino, aryloxyamino,
alkyloxyalkylamino or aryloxyalkylamino group; R₁ and R₂ are independently the same as
or different from each other and are a hydrogen atom, a hydroxyl group, a substituted or
unsubstituted alkyl, arylalkyloxy or aryloxy group; and each of m and n are independently
10 the same as or different from each other and are each an integer from about 0 to about 8.

In one embodiment, the HDAC inhibitor useful in the methods of the present
invention is represented by the structure of formula 17, or a pharmaceutically acceptable
salt or hydrate thereof:

15 wherein each of X and Y are independently the same as or different from each other and are
a hydroxyl, amino or hydroxylamino group, a substituted or unsubstituted alkyloxy,
alkylamino, dialkylamino, arylamino, alkylarylamino, or aryloxyalkylamino group; and n
is an integer from about 0 to about 8.

20 In one particular embodiment of formula 17, each of X and Y is a hydroxylamino
group; R₁ is a methyl group, R₂ is a hydrogen atom; and each of m and n is 2. In another
particular embodiment of formula 17, each of X and Y is a hydroxylamino group; R₁ is a
carbonylhydroxylamino group, R₂ is a hydrogen atom; and each of m and n is 5. In
another particular embodiment of formula 17, each of X and Y is a hydroxylamino group;
25 each of R₁ and R₂ is a fluoro group; and each of m and n is 2.

In one embodiment, the HDAC inhibitor useful in the methods of the present
invention is represented by the structure of formula 18, or a pharmaceutically acceptable
salt or hydrate thereof:

(18)

wherein each of X and Y are independently the same as or different from each other and
5 are a hydroxyl, amino or hydroxylamino group, a substituted or unsubstituted alkyloxy,
alkylamino, dialkylamino, arylamino, alkylarylamino, alkyloxyamino, aryloxyamino,
alkyloxyalkylamino or aryloxyalkylamino group; each of R₁ and R₂ are independently the
same as or different from each other and are a hydrogen atom, a hydroxyl group, a
10 substituted or unsubstituted alkyl, aryl, alkyloxy, aryloxy, carbonylhydroxylamino or
fluoro group; and each of m and n are independently the same as or different from each
other and are each an integer from about 0 to about 8.

In one embodiment, the HDAC inhibitor useful in the methods of the present
invention is represented by the structure of formula 19, or a pharmaceutically acceptable
salt or hydrate thereof:

wherein each of R₁ and R₂ are independently the same as or different from each other and
are a hydroxyl, alkyloxy, amino, hydroxylamino, alkylamino, dialkylamino, arylamino,
20 alkylarylamino, alkyloxyamino, aryloxyamino, alkyloxyalkylamino, or aryloxyalkylamino
group. In a particular embodiment, the HDAC inhibitor is a compound of structural
formula 19 wherein R₁ and R₂ are both hydroxylamino. In one particular embodiment of
formula 19, R₁ is a phenylamino group and R₂ is a hydroxylamino group

In one embodiment, the HDAC inhibitor useful in the methods of the present
25 invention is represented by the structure of formula 20, or a pharmaceutically acceptable
salt or hydrate thereof:

wherein each of R_1 and R_2 are independently the same as or different from each other and
5 are a hydroxyl, alkyloxy, amino, hydroxylamino, alkylamino, dialkylamino, arylamino, alkylaryl amino, alkyloxyamino, aryloxyamino, alkyloxyalkylamino, or aryloxyalkylamino group. In a particular embodiment, the HDAC inhibitor is a compound of structural formula 20 wherein R_1 and R_2 are both hydroxylamino.

In one embodiment, the HDAC inhibitor useful in the methods of the present
10 invention is represented by the structure of formula 21, or a pharmaceutically acceptable salt or hydrate thereof:

wherein each of R_1 and R_2 are independently the same as or different from each other and
15 are a hydroxyl, alkyloxy, amino, hydroxylamino, alkylamino, dialkylamino, arylamino, alkylaryl amino, alkyloxyamino, aryloxyamino, alkyloxyalkylamino, or aryloxyalkylamino group.

In a particular embodiment, the HDAC inhibitor is a compound of structural formula 21 wherein R_1 and R_2 are both hydroxylamino

20 In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 22, or a pharmaceutically acceptable salt or hydrate thereof:

25

wherein R is a phenylamino group substituted with a cyano, methylcyano, nitro, carboxyl, aminocarbonyl, methylaminocarbonyl, dimethylaminocarbonyl, trifluoromethyl, hydroxylaminocarbonyl, N-hydroxylaminocarbonyl, methoxycarbonyl, chloro, fluoro, methyl, methoxy, 2,3-difluoro, 2,4-difluoro, 2,5-difluoro, 2,6-difluoro, 3,5-difluoro, 2,3,6-trifluoro, 2,4,6-trifluoro, 1,2,3-trifluoro, 3,4,5-trifluoro, 2,3,4,5-tetrafluoro, or 2,3,4,5,6-pentafluoro group; and n is an integer from 4 to 8.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 23 (m-carboxycinnamic acid bishydroxamide - CBHA), or a pharmaceutically acceptable salt or hydrate thereof:

(23)

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 24, or a pharmaceutically acceptable salt or hydrate thereof:

(24)

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 25, or a pharmaceutically acceptable salt or hydrate thereof:

(25)

wherein R is a substituted or unsubstituted phenyl, piperidine, thiazole, 2-pyridine, 3-pyridine or 4-pyridine and n is an integer from about 4 to about 8.

In one particular embodiment of formula 25, R is a substituted phenyl group. In another particular embodiment of formula 25, R is a substituted phenyl group, where the
5 substituent is selected from the group consisting of methyl, cyano, nitro, thio, trifluoromethyl, amino, aminocarbonyl, methylcyano, chloro, fluoro, bromo, iodo, 2,3-difluoro, 2,4-difluoro, 2,5-difluoro, 3,4-difluoro, 3,5-difluoro, 2,6-difluoro, 1,2,3-trifluoro, 2,3,6-trifluoro, 2,4,6-trifluoro, 3,4,5-trifluoro, 2,3,5,6-tetrafluoro, 2,3,4,5,6-pentafluoro, azido, hexyl, t-butyl, phenyl, carboxyl, hydroxyl, methoxy, phenyloxy, benzyloxy,
10 phenylaminoxy, phenylaminocarbonyl, methoxycarbonyl, methylaminocarbonyl, dimethylamino, dimethylaminocarbonyl, or hydroxylaminocarbonyl group.

In another particular embodiment of formula 25, R is a substituted or unsubstituted 2-pyridine, 3-pyridine or 4-pyridine and n is an integer from about 4 to about 8.

In one embodiment, the HDAC inhibitor useful in the methods of the present
15 invention is represented by the structure of formula 26, or a pharmaceutically acceptable salt or hydrate thereof:

20 wherein R is a substituted or unsubstituted phenyl, pyridine, piperidine or thiazole group and n is an integer from about 4 to about 8 or a pharmaceutically acceptable salt thereof.

In a particular embodiment of formula 26, R is a substituted phenyl group. In another particular embodiment of formula 26, R is a substituted phenyl group, where the substituent is selected from the group consisting of methyl, cyano, nitro, thio,
25 trifluoromethyl, amino, aminocarbonyl, methylcyano, chloro, fluoro, bromo, iodo, 2,3-difluoro, 2,4-difluoro, 2,5-difluoro, 3,4-difluoro, 3,5-difluoro, 2,6-difluoro, 1,2,3-trifluoro, 2,3,6-trifluoro, 2,4,6-trifluoro, 3,4,5-trifluoro, 2,3,5,6-tetrafluoro, 2,3,4,5,6-pentafluoro, azido, hexyl, t-butyl, phenyl, carboxyl, hydroxyl, methoxy, phenyloxy, benzyloxy, phenylaminoxy, phenylaminocarbonyl, methoxycarbonyl, methylaminocarbonyl,
30 dimethylamino, dimethylaminocarbonyl, or hydroxylaminocarbonyl group.

In another particular embodiment of formula 26, R is phenyl and n is 5. In another embodiment, n is 5 and R is 3-chlorophenyl.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 27, or a pharmaceutically acceptable salt or hydrate thereof:

(27)

wherein each of R₁ and R₂ is directly attached or through a linker and is substituted or unsubstituted, aryl (e.g., phenyl), arylalkyl (e.g., benzyl), naphthyl, cycloalkyl, cycloalkylamino, pyridineamino, piperidino, 9-purine-6-amino, thiazoleamino, hydroxyl, branched or unbranched alkyl, alkenyl, alkyloxy, aryloxy, arylalkyloxy, pyridyl, or quinolinyl or isoquinolinyl; n is an integer from about 3 to about 10 and R₃ is a hydroxamic acid, hydroxylamino, hydroxyl, amino, alkylamino or alkyloxy group. The linker can be an amide moiety, e.g., O-, -S-, -NH-, NR₅, -CH₂-, -(CH₂)_m-, -(CH=CH)-, phenylene, cycloalkylene, or any combination thereof, wherein R₅ is a substitute or unsubstituted C₁-C₅ alkyl.

In certain embodiments of formula 27, R₁ is -NH-R₄ wherein R₄ is substituted or unsubstituted, aryl (e.g., phenyl), arylalkyl (e.g., benzyl), naphthyl, cycloalkyl, cycloalkylamino, pyridineamino, piperidino, 9-purine-6-amino, thiazoleamino, hydroxyl, branched or unbranched alkyl, alkenyl, alkyloxy, aryloxy, arylalkyloxy, pyridyl, quinolinyl or isoquinolinyl

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 28, or a pharmaceutically acceptable salt or hydrate thereof:

(28)

wherein each of R₁ and R₂ is, substituted or unsubstituted, aryl (e.g., phenyl), arylalkyl (e.g., benzyl), naphthyl, cycloalkyl, cycloalkylamino, pyridineamino, piperidino, 9-purine-6-amino, thiazoleamino, hydroxyl, branched or unbranched alkyl, alkenyl, alkyloxy,

aryloxy, arylalkyloxy, pyridyl, quinolinyl or isoquinolinyl; R_3 is hydroxamic acid, hydroxylamino, hydroxyl, amino, alkylamino or alkyloxy group; R_4 is hydrogen, halogen, phenyl or a cycloalkyl moiety; and A can be the same or different and represents an amide moiety, O-, -S-, -NH-, NR_5 , -CH₂-, -(CH₂)_m-, -(CH=CH)-, phenylene, cycloalkylene, or
5 any combination thereof wherein R_5 is a substitute or unsubstituted C₁-C₅ alkyl; and n and m are each an integer from 3 to 10.

In further particular embodiment compounds having a more specific structure within the scope of compounds 27 or 28 are:

In one embodiment, the HDAC inhibitor useful in the methods of the present
10 invention is represented by the structure of formula 29, or a pharmaceutically acceptable salt or hydrate thereof:

wherein A is an amide moiety, R_1 and R_2 are each selected from substituted or
15 unsubstituted aryl (e.g., phenyl), arylalkyl (e.g., benzyl), naphthyl, pyridineamino, 9-purine-6-amino, thiazoleamino, aryloxy, arylalkyloxy, pyridyl, quinolinyl or isoquinolinyl; and n is an integer from 3 to 10.

For example, the compound of formula 29 can have the structure 30 or 31:

20 wherein R_1 , R_2 and n have the meanings of formula 29.

In one embodiment, the HDAC inhibitor useful in the methods of the present
invention is represented by the structure of formula 32, or a pharmaceutically acceptable
25 salt or hydrate thereof:

(32)

wherein R₇ is selected from substituted or unsubstituted aryl (e.g., phenyl), arylalkyl (e.g., benzyl), naphthyl, pyridineamino, 9-purine-6-amino, thiazoleamino, aryloxy, arylalkyloxy,
5 pyridyl, quinolinyl or isoquinolinyl; n is an integer from 3 to 10 and Y is selected from:

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 33, or a pharmaceutically acceptable
10 salt or hydrate thereof:

(33)

wherein n is an integer from 3 to 10, Y is selected from

and R₇' is selected from

5

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 34, or a pharmaceutically acceptable salt or hydrate thereof:

10

aryl (e.g., phenyl), arylalkyl (e.g., benzyl), naphthyl, pyridineamino, 9-purine-6-amino, thiazoleamino, aryloxy, arylalkyloxy, pyridyl, quinolinyl or isoquinolinyl; n is an integer

from 3 to 10 and R₇' is selected from

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 35, or a pharmaceutically acceptable salt or hydrate thereof:

wherein A is an amide moiety, R₁ and R₂ are each selected from substituted or unsubstituted aryl (e.g., phenyl), arylalkyl (e.g., benzyl), naphthyl, pyridineamino, 9-purine-6-amino, thiazoleamino, aryloxy, arylalkyloxy, pyridyl, quinolinyl or isoquinolinyl; R₄ is hydrogen, a halogen, a phenyl or a cycloalkyl moiety and n is an integer from 3 to 10.

For example, the compound of formula 35 can have the structure 36 or 37:

wherein R₁, R₂, R₄ and n have the meanings of formula 35.

In one embodiment, the HDAC inhibitor useful in the methods of the present invention is represented by the structure of formula 38, or a pharmaceutically acceptable salt or hydrate thereof:

wherein L is a linker selected from the group consisting of an amide moiety, O-, -S-, -NH-,
5 , NR₅, -CH₂-, -(CH₂)_m-, -(CH=CH)-, phenylene, cycloalkylene, or any combination
thereof wherein R₅ is a substitute or unsubstituted C₁-C₅ alkyl; and wherein each of R₇ and
R₈ are independently a substituted or unsubstituted aryl (e.g., phenyl), arylalkyl (e.g.,
benzyl), naphthyl, pyridineamino, 9-purine-6-amino, thiazoleamino, aryloxy, arylalkyloxy,
pyridyl, quinolinyl or isoquinolinyl; n is an integer from 3 to 10 and m is an integer from
10 0-10.

For example, a compound of formula 38 can be represented by the structure of
formula (39), or a pharmaceutically acceptable salt or hydrate thereof:

15

Other HDAC inhibitors suitable for use in the methods of the present invention
include those shown in the following more specific formulas:

A compound represented by the structure:

(40)

wherein n is an integer from 3 to 10, or an enantiomer thereof. In one particular
5 embodiment of formula 40, n=5.

A compound represented by the structure:

(41)

10 wherein n is an integer from 3 to 10, or an enantiomer thereof. In one particular
embodiment of formula 41, n=5.

A compound represented by the structure:

(42)

wherein n is an integer from 3 to 10 or an enantiomer thereof. In one particular
5 embodiment of formula 42, n=5.

A compound represented by the structure:

(43)

10

wherein n is an integer from 3 to 10, or an enantiomer thereof. In one particular
embodiment of formula 43, n=5.

15

A compound represented by the structure:

(44)

wherein n is an integer from 3 to 10 or an enantiomer thereof. In one particular
5 embodiment of formula 44, n=5.

A compound represented by the structure:

10

(45)

wherein n is an integer from 3 to 10, or an enantiomer thereof. In one particular
15 embodiment of formula 45, n=5.

wherein n is an integer from 3 to 10 or an enantiomer thereof. In one particular
5 embodiment of formula 46, n=5.

10

A compound represented by the structure:

15 wherein n is an integer from 3 to 10, or an enantiomer thereof. In one particular
embodiment of formula 47, n=5.

A compound represented by the structure:

(48)

wherein n is an integer from 3 to 10, or an enantiomer thereof. In one particular
5 embodiment of formula 48, n=5.

10

A compound represented by the structure:

(49)

15 wherein n is an integer from 3 to 10, or an enantiomer thereof. In one particular
embodiment of formula 49, n=5.

A compound represented by the structure:

(50)

- 5 wherein n is an integer from 3 to 10, or an enantiomer thereof. In one particular embodiment of formula 50, $n=5$.

A compound represented by the structure:

(51)

- 10 wherein n is an integer from 3 to 10, or an enantiomer thereof. In one particular embodiment of formula 51, $n=5$.

Other examples of such compounds and other HDAC inhibitors can be found in U.S. Patent No. 5,369,108, issued on November 29, 1994, U.S. Patent No. 5,700,811, issued on December 23, 1997, U.S. Patent No. 5,773,474, issued on June 30, 1998, U.S. Patent No. 5,932,616, issued on August 3, 1999 and U.S. Patent No. 6,511,990, issued January 28, 2003, all to Breslow *et al.*; U.S. Patent No. 5,055,608, issued on October 8, 1991, U.S. Patent No. 5,175,191, issued on December 29, 1992 and U.S. Patent No. 5,608,108, issued on March 4, 1997, all to Marks *et al.*; as well as Yoshida, M., *et al.*, Bioassays 17, 423-430 (1995); Saito, A., *et al.*, PNAS USA 96, 4592-4597, (1999); Furamai R. *et al.*, PNAS USA 98 (1), 87-92 (2001); Komatsu, Y., *et al.*, Cancer Res. 61(11), 4459-4466 (2001); Su, G.H., *et al.*, Cancer Res. 60, 3137-3142 (2000); Lee, B.I. *et*

al., Cancer Res. 61(3), 931-934; Suzuki, T., *et al.*, J. Med. Chem. 42(15), 3001-3003 (1999); published PCT Application WO 01/18171 published on March 15, 2001 to Sloan-Kettering Institute for Cancer Research and The Trustees of Columbia University; published PCT Application WO02/246144 to Hoffmann-La Roche; published PCT Application WO02/22577 to Novartis; published PCT Application WO02/30879 to Prolifix; published PCT Applications WO 01/38322 (published May 31, 2001), WO 01/70675 (published on September 27, 2001) and WO 00/71703 (published on November 30, 2000) all to Methylgene, Inc.; published PCT Application WO 00/21979 published on October 8, 1999 to Fujisawa Pharmaceutical Co., Ltd.; published PCT Application WO 98/40080 published on March 11, 1998 to Beacon Laboratories, L.L.C.; and Curtin M. (Current patent status of HDAC inhibitors *Expert Opin. Ther. Patents* (2002) 12(9): 1375-1384 and references cited therein).

SAHA or any of the other HDACs can be synthesized according to the methods outlined in the Experimental Details Section, or according to the method set forth in U.S. Patent Nos. 5,369,108, 5,700,811, 5,932,616 and 6,511,990, the contents of which are incorporated by reference in their entirety, or according to any other method known to a person skilled in the art.

Specific non-limiting examples of HDAC inhibitors are provided in the Table below. It should be noted that the present invention encompasses any compounds which are structurally similar to the compounds represented below, and which are capable of inhibiting histone deacetylases.

Chemical Definitions

An "aliphatic group" is non-aromatic, consists solely of carbon and hydrogen and can optionally contain one or more units of unsaturation, e.g., double and/or triple bonds.

- 5 An aliphatic group can be straight chained, branched or cyclic. When straight chained or branched, an aliphatic group typically contains between about 1 and about 12 carbon atoms, more typically between about 1 and about 6 carbon atoms. When cyclic, an aliphatic group typically contains between about 3 and about 10 carbon atoms, more typically between about 3 and about 7 carbon atoms. Aliphatic groups are preferably C₁-C₁₂ straight chained or branched alkyl groups (i.e., completely saturated aliphatic groups), more preferably C₁-C₆ straight chained or branched alkyl groups. Examples include methyl, ethyl, n-propyl, iso-propyl, n-butyl, sec-butyl and tert-butyl.

- 15 An "aromatic group" (also referred to as an "aryl group") as used herein includes carbocyclic aromatic groups, heterocyclic aromatic groups (also referred to as "heteroaryl") and fused polycyclic aromatic ring system as defined herein.

- 20 A "carbocyclic aromatic group" is an aromatic ring of 5 to 14 carbons atoms, and includes a carbocyclic aromatic group fused with a 5-or 6-membered cycloalkyl group such as indan. Examples of carbocyclic aromatic groups include, but are not limited to, phenyl, naphthyl, e.g., 1-naphthyl and 2-naphthyl; anthracenyl, e.g., 1-anthracenyl, 2-anthracenyl; phenanthrenyl; fluorenyl, e.g., 9-fluorenyl, indanyl and the like. A carbocyclic aromatic group is optionally substituted with a designated number of substituents, described below.

A "heterocyclic aromatic group" (or "heteroaryl") is a monocyclic, bicyclic or tricyclic aromatic ring of 5- to 14-ring atoms of carbon and from one to four heteroatoms selected from O, N, or S. Examples of heteroaryl include, but are not limited to pyridyl, e.g., 2-pyridyl (also referred to as α -pyridyl), 3-pyridyl (also referred to as β -pyridyl) and 4-pyridyl (also referred to as γ -pyridyl); thienyl, e.g., 2-thienyl and 3-thienyl; furanyl, e.g., 2-furanyl and 3-furanyl; pyrimidyl, e.g., 2-pyrimidyl and 4-pyrimidyl; imidazolyl, e.g., 2-imidazolyl; pyranyl, e.g., 2-pyranyl and 3-pyranyl; pyrazolyl, e.g., 4-pyrazolyl and 5-pyrazolyl; thiazolyl, e.g., 2-thiazolyl, 4-thiazolyl and 5-thiazolyl; thiadiazolyl; isothiazolyl; oxazolyl, e.g., 2-oxazolyl, 4-oxazolyl and 5-oxazolyl; isoxazolyl; pyrrolyl; pyridazinyl; pyrazinyl and the like. Heterocyclic aromatic (or heteroaryl) as defined above may be optionally substituted with a designated number of substituents, as described below for aromatic groups.

A "fused polycyclic aromatic" ring system is a carbocyclic aromatic group or heteroaryl fused with one or more other heteroaryl or nonaromatic heterocyclic ring. Examples include, quinoliny and isoquinoliny, e.g., 2-quinoliny, 3-quinoliny, 4-quinoliny, 5-quinoliny, 6-quinoliny, 7-quinoliny and 8-quinoliny, 1-isoquinoliny, 3-quinoliny, 4-isoquinoliny, 5-isoquinoliny, 6-isoquinoliny, 7-isoquinoliny and 8-isoquinoliny; benzofuranyl e.g., 2-benzofuranyl and 3-benzofuranyl; dibenzofuranyl.e.g., 2,3-dihydrobenzofuranyl; dibenzothiophenyl; benzothienyl, e.g., 2-benzothienyl and 3-benzothienyl; indolyl, e.g., 2-indolyl and 3-indolyl; benzothiazolyl, e.g., 2-benzothiazolyl; benzooxazolyl, e.g., 2-benzooxazolyl; benzimidazolyl, e.g., 2-benzimidazolyl; isoindolyl, e.g., 1-isoindolyl and 3-isoindolyl; benzotriazolyl; purinyl; thianaphthenyl and the like. Fused polycyclic aromatic ring systems may optionally be substituted with a designated number of substituents, as described herein.

An "aralkyl group" (arylalkyl) is an alkyl group substituted with an aromatic group, preferably a phenyl group. A preferred aralkyl group is a benzyl group. Suitable aromatic groups are described herein and suitable alkyl groups are described herein. Suitable substituents for an aralkyl group are described herein.

An "aryloxy group" is an aryl group that is attached to a compound via an oxygen (e.g., phenoxy).

An "alkoxy group"(alkyloxy), as used herein, is a straight chain or branched C₁-C₁₂ or cyclic C₃-C₁₂ alkyl group that is connected to a compound via an oxygen atom.

Examples of alkoxy groups include but are not limited to methoxy, ethoxy and propoxy.

An "arylalkoxy group" (arylalkyloxy) is an arylalkyl group that is attached to a compound via an oxygen on the alkyl portion of the arylalkyl (e.g., phenylmethoxy).

5 An "arylamino group" as used herein, is an aryl group that is attached to a compound via a nitrogen.

As used herein, an "arylalkylamino group" is an arylalkyl group that is attached to a compound via a nitrogen on the alkyl portion of the arylalkyl.

10 As used herein, many moieties or groups are referred to as being either "substituted or unsubstituted". When a moiety is referred to as substituted, it denotes that any portion of the moiety that is known to one skilled in the art as being available for substitution can be substituted. For example, the substitutable group can be a hydrogen atom that is replaced with a group other than hydrogen (i.e., a substituent group). Multiple substituent groups can be present. When multiple substituents are present, the substituents can be the same or different and substitution can be at any of the substitutable sites. Such means for
15 substitution are well known in the art. For purposes of exemplification, which should not be construed as limiting the scope of this invention, some examples of groups that are substituents are: alkyl groups (which can also be substituted, with one or more substituents, such as CF₃), alkoxy groups (which can be substituted, such as OCF₃), a halogen or halo group (F, Cl, Br, I), hydroxy, nitro, oxo, -CN, -COH, -COOH, amino, azido, N-alkylamino or N,N-dialkylamino (in which the alkyl groups can also be
20 substituted), esters (-C(O)-OR, where R can be a group such as alkyl, aryl, etc., which can be substituted), aryl (most preferred is phenyl, which can be substituted), arylalkyl (which can be substituted) and aryloxy.

25 **Stereochemistry**

Many organic compounds exist in optically active forms having the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L or R and S are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes d and l or (+) and (-) are employed to designate the sign of
30 rotation of plane-polarized light by the compound, with (-) or meaning that the compound is levorotatory. A compound prefixed with (+) or d is dextrorotatory. For a given chemical structure, these compounds, called stereoisomers, are identical except that they are non-

superimposable mirror images of one another. A specific stereoisomer can also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. A 50:50 mixture of enantiomers is referred to as a racemic mixture. Many of the compounds described herein can have one or more chiral centers and therefore can exist in different enantiomeric forms. If desired, a chiral carbon can be designated with an asterisk (*)

5 When bonds to the chiral carbon are depicted as straight lines in the formulas of the invention, it is understood that both the (R) and (S) configurations of the chiral carbon, and hence both enantiomers and mixtures thereof, are embraced within the formula. As is used in the art, when it is desired to specify the absolute configuration about a chiral carbon, one of the bonds to the chiral carbon can be depicted as a wedge (bonds to atoms above the plane) and the other can be depicted as a series or wedge of short parallel lines

10 is (bonds to atoms below the plane). The Cahn-Ingold-Prelog system can be used to assign the (R) or (S) configuration to a chiral carbon.

When the HDAC inhibitors of the present invention contain one chiral center, the compounds exist in two enantiomeric forms and the present invention includes both enantiomers and mixtures of enantiomers, such as the specific 50:50 mixture referred to as a racemic mixtures. The enantiomers can be resolved by methods known to those skilled in the art, for example by formation of diastereoisomeric salts which may be separated, for example, by crystallization (see, CRC Handbook of Optical Resolutions via

15 Diastereomeric Salt Formation by David Kozma (CRC Press, 2001)); formation of diastereoisomeric derivatives or complexes which may be separated, for example, by crystallization, gas-liquid or liquid chromatography; selective reaction of one enantiomer with an enantiomer-specific reagent, for example enzymatic esterification; or gas-liquid or liquid chromatography in a chiral environment, for example on a chiral support for

20 example silica with a bound chiral ligand or in the presence of a chiral solvent. It will be appreciated that where the desired enantiomer is converted into another chemical entity by one of the separation procedures described above, a further step is required to liberate the desired enantiomeric form. Alternatively, specific enantiomers may be synthesized by asymmetric synthesis using optically active reagents, substrates, catalysts or solvents, or

25 by converting one enantiomer into the other by asymmetric transformation.

30

Designation of a specific absolute configuration at a chiral carbon of the compounds of the invention is understood to mean that the designated enantiomeric form

of the compounds is in enantiomeric excess (ee) or in other words is substantially free from the other enantiomer. For example, the "R" forms of the compounds are substantially free from the "S" forms of the compounds and are, thus, in enantiomeric excess of the "S" forms. Conversely, "S" forms of the compounds are substantially free of "R" forms of the compounds and are, thus, in enantiomeric excess of the "R" forms. Enantiomeric excess, as used herein, is the presence of a particular enantiomer at greater than 50%. For example, the enantiomeric excess can be about 60% or more, such as about 70% or more, for example about 80% or more, such as about 90% or more. In a particular embodiment when a specific absolute configuration is designated, the enantiomeric excess of depicted compounds is at least about 90%. In a more particular embodiment, the enantiomeric excess of the compounds is at least about 95%, such as at least about 97.5%, for example, at least 99% enantiomeric excess.

When a compound of the present invention has two or more chiral carbons it can have more than two optical isomers and can exist in diastereoisomeric forms. For example, when there are two chiral carbons, the compound can have up to 4 optical isomers and 2 pairs of enantiomers ((S,S)/(R,R) and (R,S)/(S,R)). The pairs of enantiomers (e.g., (S,S)/(R,R)) are mirror image stereoisomers of one another. The stereoisomers that are not mirror images (e.g., (S,S) and (R,S)) are diastereomers. The diastereoisomeric pairs may be separated by methods known to those skilled in the art, for example chromatography or crystallization and the individual enantiomers within each pair may be separated as described above. The present invention includes each diastereoisomer of such compounds and mixtures thereof.

As used herein, "a," "an" and "the" include singular and plural referents unless the context clearly dictates otherwise. Thus, for example, reference to "an active agent" or "a pharmacologically active agent" includes a single active agent as well as two or more different active agents in combination, reference to "a carrier" includes mixtures of two or more carriers as well as a single carrier, and the like.

This invention is also intended to encompass pro-drugs of the HDAC inhibitors disclosed herein. A prodrug of any of the compounds can be made using well-known pharmacological techniques.

This invention, in addition to the above listed compounds, is intended to encompass the use of homologs and analogs of such compounds. In this context, homologs

are molecules having substantial structural similarities to the above-described compounds and analogs are molecules having substantial biological similarities regardless of structural similarities.

The invention also encompasses pharmaceutical compositions comprising
5 pharmaceutically acceptable salts of the HDAC inhibitors with organic and inorganic acids, for example, acid addition salts which may, for example, be hydrochloric acid, sulphuric acid, methanesulphonic acid, fumaric acid, maleic acid, succinic acid, acetic acid, benzoic acid, oxalic acid, citric acid, tartaric acid, carbonic acid, phosphoric acid and the like. Pharmaceutically acceptable salts can also be prepared from by treatment
10 with inorganic bases, for example, sodium, potassium, ammonium, calcium, or ferric hydroxides, and such organic bases as isopropylamine, trimethylamine, 2-ethylamino ethanol, histidine, procaine, and the like.

The invention also encompasses pharmaceutical compositions comprising hydrates of the HDAC inhibitors. The term "hydrate" includes but is not limited to hemihydrate,
15 monohydrate, dihydrate, trihydrate and the like.

In addition, this invention also encompasses pharmaceutical compositions comprising any solid or liquid physical form of SAHA or any of the other HDAC inhibitors. For example, The HDAC inhibitors can be in a crystalline form, in amorphous form, and have any particle size. The HDAC inhibitor particles may be micronized, or
20 may be agglomerated, particulate granules, powders, oils, oily suspensions or any other form of solid or liquid physical form.

Therapeutic Uses of HDAC Inhibitors

1. Treatment of Cancer

25 As demonstrated herein, the HDAC inhibitors of the present invention are useful for the treatment of cancer. Accordingly, in one embodiment, the invention relates to a method of treating cancer in a subject in need of treatment comprising administering to said subject a therapeutically effective amount of a histone deacetylase inhibitor described herein.

30 The term "cancer" refers to any cancer caused by the proliferation of neoplastic cells, such as solid tumors, neoplasms, carcinomas, sarcomas, leukemias, lymphomas and the like. For example, cancers include, but are not limited to: leukemias including acute

leukemias and chronic leukemias such as acute lymphocytic leukemia (ALL), Acute myeloid leukemia (AML), chronic lymphocytic leukemia (CLL), chronic myelogenous leukemia (CML) and Hairy Cell Leukemia; lymphomas such as cutaneous T-cell lymphomas (CTCL), noncutaneous peripheral T-cell lymphomas, lymphomas associated
5 with human T-cell lymphotropic virus (HTLV) such as adult T-cell leukemia/lymphoma (ATLL), Hodgkin's disease and non-Hodgkin's lymphomas;; multiple myeloma; childhood solid tumors such as brain tumors, neuroblastoma, retinoblastoma, Wilms' tumor, bone tumors, and soft-tissue sarcomas, common solid tumors of adults such as head and neck cancers (e.g., oral, laryngeal and esophageal), genito urinary cancers (e.g., prostate,
10 bladder, renal, uterine, ovarian, testicular, rectal and colon), lung cancer, breast cancer, pancreatic cancer, melanoma and other skin cancers, stomach cancer, brain tumors, liver cancer and thyroid cancer.

2. Treatment of Leukemia

15 As demonstrated herein, the HDAC inhibitors are useful for the treatment of leukemia.

There are several types of leukemia. Leukemia is either acute or chronic. In acute leukemia, the abnormal blood cells are blasts that remain very immature and cannot carry out their normal functions. The number of blasts increases rapidly, and the disease
20 becomes worse quickly. In chronic leukemia, some blast cells are present, but in general, these cells are more mature and can carry out some of their normal functions. Also, the number of blasts increases less rapidly than in acute leukemia. As a result, chronic leukemia worsens gradually.

Leukemia can arise in either of the two main types of white blood cells: lymphoid
25 cells or myeloid cells. When leukemia affects lymphoid cells, it is called lymphocytic leukemia. When myeloid cells are affected, the disease is called myeloid or myelogenous leukemia.

The most common types of leukemia are:

A) Acute Lymphocytic Leukemia (ALL) is the most common type of leukemia in
30 young children. This disease also affects adults, especially those age 65 and older.

B) Acute Myeloid Leukemia (AML) occurs in both adults and children. This type of leukemia is sometimes called acute nonlymphocytic leukemia (ANLL).

C) Chronic lymphocytic leukemia (CLL) most often affects adults over the age of 55. It sometimes occurs in younger adults, but it almost never affects children.

D) Chronic myeloid leukemia (CML) occurs mainly in adults. A very small number of children also develop this disease.

5 E) Hairy cell leukemia is an uncommon type of chronic leukemia.

A) Acute lymphocytic leukemia (ALL)

Acute lymphocytic leukemia (ALL) is a rapidly progressing form of leukemia that is characterized by the presence in the blood and bone marrow of large numbers of
10 unusually immature white blood cells destined to become lymphocytes. Acute lymphocytic leukemia is also known as acute lymphoblastic leukemia.

There are a number of different subtypes of ALL. ALL is classified using a system called the French American British (FAB) system. In this system, the subtypes of ALL are grouped according to the particular cell line in which the disease developed. There are
15 three distinct types of ALL, designated L1 through L3, as set forth in the Table below:

French-American-British (FAB) Classification of ALL

FAB Subtype	Approximate % of adult ALL patients	Immunologic Type	Comments
L1	30%	T cell or pre-B cell	
L2	65%	T cell or pre-B cell	
L3	5%	B cell	Also called Burkitt's type leukemia.

ALL is the most common cancer occurring in children, representing almost 25% of cancer among children. There is a sharp peak in the incidence of ALL incidence among
20 children ages 2 to 3. This peak is approximately fourfold greater than that for infants and is nearly 10-fold greater than that for youths who are 19 years old. The incidence of ALL is substantially higher for white children than for black children, with a nearly threefold higher incidence at 2 to 3 years of age for white children compared to black children. The incidence of ALL appears to be highest in Hispanic children. Factors associated with an
25 increased risk of ALL have been identified. The main environmental factor is radiation,

namely prenatal exposure to x-rays or postnatal exposure to high doses of radiation. Children with Down syndrome (trisomy 21) also have an increased risk for both ALL and acute myeloid leukemia (AML). About two-thirds of acute leukemia in children with Down syndrome is ALL. Increased occurrence of ALL is also associated with certain genetic conditions, including neurofibromatosis, Shwachman syndrome, Bloom syndrome, and ataxia telangiectasia.

The malignant lymphoblasts from a particular ALL patient carry antigen receptors unique to that patient. There is evidence to suggest that the specific antigen receptor may be present at birth in some patients with ALL, suggesting a prenatal origin for the leukemic clone. Similarly, some patients with ALL characterized by specific chromosome translocations have been shown to have cells containing the translocation at the time of birth.

The malignant lymphoblasts from a particular ALL patient carry antigen receptors unique to that patient. There is evidence to suggest that the specific antigen receptor may be present at birth in some patients with ALL, suggesting a prenatal origin for the leukemic clone. Similarly, some patients with ALL characterized by specific chromosome translocations have been shown to have cells containing the translocation at the time of birth.

Seventy-five to 80% of children with ALL now survive at least 5 years from diagnosis with current treatments that incorporate systemic therapy (e.g., combination chemotherapy) and specific central nervous system (CNS) preventive therapy (i.e., intrathecal chemotherapy with or without cranial irradiation). Ten-year event-free survival of multiple large prospective trials conducted in different countries for children treated primarily in the 1980s is approximately 70%.

Since nearly all children with ALL achieve an initial remission, the major obstacle to cure is bone marrow and/or extramedullary (e.g., CNS, testicular) relapse. Relapse from remission can occur during therapy or after completion of treatment. While the majority of children with recurrent ALL attain a second remission, the likelihood of cure is generally poor, particularly for those with bone marrow relapse occurring while on treatment.

B) Acute Myeloid Leukemia (AML)

Acute Myeloid Leukemia (AML) is a rapidly progressive disease, characterized by rapid proliferation of immature blood-forming cells in the blood and bone marrow, the cells being specifically those destined to give rise to granulocytes and monocytes. AML can occur in adults or children. Acute myeloid leukemia is also known as acute myelogenous leukemia or acute nonlymphocytic leukemia (ANLL).

There are a number of different subtypes of AML. AML is also classified using the French American British (FAB) system. In this system, the subtypes of AML are grouped according to the particular cell line in which the disease developed. There are eight distinct types of AML, designated M0 through M7, as set forth in the Table below:

French-American-British (FAB) Classification of AML

FAB Subtype	Name	Approximate % of adult AML patients
M0	Undifferentiated AML	5%
M1	Myeloblastic leukemia with minimal maturation	15%
M2	Myeloblastic leukemia with maturation	25%
M3	Promyelocytic leukemia	10%
M4	Myelomonocytic leukemia	25%
M4 eos	Myelomonocytic leukemia with eosinophilia	Rare
M5	Monocytic leukemia	10%
M6	Erythroid leukemia	5%
M7	Megakaryoblastic leukemia	5%

Types M2 (myeloblastic leukemia with maturation) and M4 (myelomonocytic leukemia) each account for 25% of AML; M1 (myeloblastic leukemia, with few or no mature cells) accounts for 15%; M3 (promyelocytic leukemia) and M5 (monocytic leukemia) each account for 10% of cases; the other subtypes are rarely seen. AML is also classified according to the chromosomal abnormalities in the malignant cells.

The primary treatment of AML is chemotherapy. Radiation therapy is less common; it may be used in certain cases. Bone marrow transplantation is under study in clinical trials and is coming into increasing use. There are two phases of treatment for AML. The first phase is called induction therapy. The purpose of induction therapy is to kill as many of the leukemia cells as possible and induce a remission, a state in which

there is no visible evidence of disease and blood counts are normal. Patients may receive a combination of drugs during this phase including daunorubicin, idarubicin, or mitoxantrone plus cytarabine and thioguanine. Once in remission with no signs of leukemia, patients enter a second phase of treatment. The second phase of treatment is called post-remission therapy (or continuation therapy). It is designed to kill any remaining leukemic cells. In post-remission therapy, patients may receive high doses of chemotherapy, designed to eliminate any remaining leukemic cells. Treatment may include a combination of cytarabine, daunorubicin, idarubicin, etoposide, cyclophosphamide, mitoxantrone, or cytarabine.

10 The treatment of the subtype of AML called acute promyelocytic leukemia (APL) differs from that for other forms of AML. (APL is M3 in the FAB system.) Most APL patients are now treated first with all-trans-retinoic acid (ATRA), which induces a complete response in 70% of cases and extends survival. APL patients are then given a course of consolidation therapy, which is likely to include cytosine arabinoside (Ara-C) and idarubicin.

15 Bone marrow transplantation is used to replace the bone marrow with healthy bone marrow. First, all of the bone marrow in the body is destroyed with high doses of chemotherapy with or without radiation therapy. Healthy marrow is then taken from another person (a donor) whose tissue is the same as or almost the same as the patient's. The donor may be a twin (the best match), a brother or sister, or a person who is otherwise related or not related. The healthy marrow from the donor is given to the patient through a needle in the vein, and the marrow replaces the marrow that was destroyed. A bone marrow transplant using marrow from a relative or from a person who is not related is called an allogeneic bone marrow transplant. A greater chance for recovery occurs if the doctor chooses a hospital that does more than five bone marrow transplantations per year.

C) Chronic myelogenous leukemia (CML):

30 Chronic myelogenous leukemia (CML), also called chronic myelocytic leukemia, and chronic granulocytic leukemia, is a chronic malignant disease in which too many white blood cells belonging to the myeloid line of cells are made in the bone marrow. The disease is due to the growth and evolution of an abnormal clone of cells containing a chromosome rearrangement known as the Philadelphia (or Ph) chromosome.

Chronic myelogenous leukemia affects the blasts that are developing into white blood cells called granulocytes. The blasts do not mature and become too numerous. These immature blast cells are then found in the blood and the bone marrow.

5 Chronic myelogenous leukemia progresses slowly and usually occurs in people who are middle-aged or older, although it also can occur in children.

CML progresses through different phases and these phases are the stages used to plan treatment. The following stages are used for chronic myelogenous leukemia: A) Chronic phase: There are few blast cells in the blood and bone marrow and there may be no symptoms of leukemia. This phase may last from several months to several years; B) 10 Accelerated phase: There are more blast cells in the blood and bone marrow, and fewer normal cells; C) Blastic phase: More than 30% of the cells in the blood or bone marrow are blast cells. Sometimes blast cells will form tumors outside of the bone marrow in places such as the bone or lymph nodes; and D) Refractory CML: Leukemia cells do not decrease even though treatment is given.

15 There are treatments for all patients with CML. Three kinds of treatment are currently (as of November, 2000) in standard usage: Chemotherapy, Radiation therapy, and Bone marrow transplantation. Biologic therapy is also being tested and appears quite promising.

D) Chronic lymphocytic leukemia (CLL):

20 Chronic lymphocytic leukemia (CLL) is the most common form of leukemia in adults, in which the lymphocytes may look fairly normal but are not fully mature and do not fight infection effectively. Approximately 10,000 new cases are diagnosed each year. The malignant cells are found in the blood and bone marrow, collect in and enlarge the lymph nodes, and may crowd out other blood cells in the bone marrow, resulting in a 25 shortage of red blood cells (producing anemia) and platelets (producing easy bruising and bleeding).

CLL is most common in people over 60 and progresses slowly. Treatment may include chemotherapy, radiation, leukapheresis (a procedure to remove the extra lymphocytes) and bone marrow transplantation.

30 CLL is an enigmatic type of leukemia in that the clinical course and outcome vary considerably from patient to patient, and therefore the outlook is unpredictable. About two-thirds of patients live with the disease for decades and die from other causes while

about a third of patients experience difficulties soon after diagnosis, require frequent and often multiple forms of therapy, yet succumb to the illness within a few years. Cells that produce a protein called ZAP-70 are more common in cases of CLL with poor outcomes. The capacity to make ZAP-70 protein appears limited to CLL cells with unmutated immunoglobulin genes.

Unlike most of the other forms of acute and chronic leukemia, substantial therapeutic progress has not been made over the past 40 years in either prolongation of survival or the introduction of curative therapy. The addition of fludarabine early in the treatment of symptomatic CLL patients has led to a higher rate of complete responses (27% v 3%) and duration of progression free survival (33 v 17 months) as compared with previously used alkylator-based therapies. Although attaining a complete clinical response after therapy is the initial step toward improving survival in CLL, the majority of patients either does not attain complete remission or fail to respond to fludarabine. Furthermore, all patients with CLL treated with fludarabine eventually relapse, making its role as a single agent purely palliative.

In addition to drug resistance, patients with CLL have compromised bone marrow function and an inherent immune deficiency as a consequence of their underlying disease. Both the immune dysfunction and marrow deficiency are accentuated by currently applied therapies for CLL (i.e., fludarabine and property for a new agent entering clinical trials in CLL, therefore, would include selective cytotoxicity toward the leukemic cell with minimal effect on normal bone marrow progenitors or immune effector cells. We describe here depsipeptide, a novel bicyclic depsipeptide currently under evaluation in phase I clinical trials, that demonstrates marked in vitro selective cytotoxicity toward human CLL cells as well as favorable changes in protein expression of key apoptotic-related proteins.

E) Hairy-cell Leukemia:

Hairy-cell leukemia is a disease in which there are cancer cells in the blood and bone marrow called hairy cells. The hairy cells are malignant white blood cells of the B-cell type. Hairy-cell leukemia accounts for 2% of all cases of leukemia. When hairy-cell leukemia develops, the leukemic cells may collect in the spleen, and the spleen may become enlarged (splenomegaly). There also may be too few normal blood cells of all types (pancytopenia) because the leukemic cells invade the bone marrow and the marrow

cannot produce enough normal blood cells. The deficit of different types of normal blood cells can lead to anemia, easy bleeding, and a tendency to infection.

Splenectomy provides palliation but not a cure. Treatment with drugs, principally interferon alfa and purine analogues (such as cladribine and pentostatin), permits the survival of the majority of patients 8 years following their initial diagnosis. For the resistant cases, a promising immunotoxin has been developed that targets CD22, a molecule expressed exclusively on the surface of B-cells including virtually all hairy cells.

As described above, the various forms of leukemia are generally characterized by an abnormal quantity of blasts, i.e., immature blood cells destined to mature into blood cells. Leukemic blasts do not grow and age normally; they proliferate wildly and fail to mature. As such, a reduction in the number of blasts is indicative of a positive response to treatment.

Accordingly, the present invention also encompasses methods of reducing or eliminating the number of blasts in a subject's blood, by administering to the subject a pharmaceutical composition comprising an effective amount of HDAC inhibitor as described herein. The HDAC inhibitor can be SAHA, or it can be any one or more of the HDAC inhibitors described hereinabove, administered according to any of the dosages or dosing schedules as described herein.

The term "reducing" encompasses a reduction in the number of blasts by about 1%-99%, for example by 5-95%, 10-90%, 10-30%, 10-20%, 15-75%, 20-60%, 30-50%, 40-50% and the like. The number of blasts can also be eliminated completely (i.e., 100% of the blasts). The term "blasts" includes but is not limited to peripheral blasts, bone marrow blasts and the like.

3. Other uses of HDAC inhibitors

HDAC inhibitors are effective at treating a broader range of diseases characterized by the proliferation of neoplastic diseases, such as any one of the cancers described hereinabove. However, the therapeutic utility of HDAC inhibitors is not limited to the treatment of cancer. Rather, there is a wide range of diseases for which HDAC inhibitors have been found useful.

For example, HDAC inhibitors, in particular SAHA, have been found to be useful in the treatment of a variety of acute and chronic inflammatory diseases, autoimmune

diseases, allergic diseases, diseases associated with oxidative stress, and diseases characterized by cellular hyperproliferation. Non-limiting examples are inflammatory conditions of a joint including and rheumatoid arthritis (RA) and psoriatic arthritis; inflammatory bowel diseases such as Crohn's disease and ulcerative colitis; 5 spondyloarthropathies; scleroderma; psoriasis (including T-cell mediated psoriasis) and inflammatory dermatoses such as dermatitis, eczema, atopic dermatitis, allergic contact dermatitis, urticaria; vasculitis (e.g., necrotizing, cutaneous, and hypersensitivity vasculitis); eosinophilic myositis, eosinophilic fasciitis; cancers with leukocyte infiltration of the skin or organs, ischemic injury, including cerebral ischemia (e.g., brain injury as a 10 result of trauma, epilepsy, hemorrhage or stroke, each of which may lead to neurodegeneration); HIV, heart failure, chronic, acute or malignant liver disease, autoimmune thyroiditis; systemic lupus erythematosus, Sjorgren's syndrome, lung diseases (e.g., ARDS); acute pancreatitis; amyotrophic lateral sclerosis (ALS); Alzheimer's disease; cachexia/anorexia; asthma; atherosclerosis; chronic fatigue 15 syndrome, fever; diabetes (e.g., insulin diabetes or juvenile onset diabetes); glomerulonephritis; graft versus host rejection (e.g., in transplantation); hemorrhagic shock; hyperalgesia; inflammatory bowel disease; multiple sclerosis; myopathies (e.g., muscle protein metabolism, esp. in sepsis); osteoporosis; Parkinson's disease; pain; pre-term labor; psoriasis; reperfusion injury; cytokine-induced toxicity (e.g., septic shock, 20 endotoxic shock); side effects from radiation therapy, temporal mandibular joint disease, tumor metastasis; or an inflammatory condition resulting from strain, sprain, cartilage damage, trauma such as burn, orthopedic surgery, infection or other disease processes. Allergic diseases and conditions, include but are not limited to respiratory allergic diseases such as asthma, allergic rhinitis, hypersensitivity lung diseases, hypersensitivity 25 pneumonitis, eosinophilic pneumonias (e.g., Loeffler's syndrome, chronic eosinophilic pneumonia), delayed-type hypersensitivity, interstitial lung diseases (ILD) (e.g., idiopathic pulmonary fibrosis, or ILD associated with rheumatoid arthritis, systemic lupus erythematosus, ankylosing spondylitis, systemic sclerosis, Sjogren's syndrome, polymyositis or dermatomyositis); systemic anaphylaxis or hypersensitivity responses, 30 drug allergies (e.g., to penicillin, cephalosporins), insect sting allergies, and the like.

For example, HDAC inhibitors, and in particular SAHA, have been found to be useful in the treatment of a variety of neurodegenerative diseases, a non-exhaustive list of

which is:

- I. Disorders characterized by progressive dementia in the absence of other prominent neurologic signs, such as Alzheimer's disease; Senile dementia of the Alzheimer type; and Pick's disease (lobar atrophy).
- 5 II. Syndromes combining progressive dementia with other prominent neurologic abnormalities such as A) syndromes appearing mainly in adults (e.g., Huntington's disease, Multiple system atrophy combining dementia with ataxia and/or manifestations of Parkinson's disease, Progressive supranuclear palsy (Steel-Richardson-Olszewski), diffuse Lewy body disease, and corticodentatonigral degeneration); and B) syndromes appearing
10 mainly in children or young adults (e.g., Hallervorden-Spatz disease and progressive familial myoclonic epilepsy).
- III. Syndromes of gradually developing abnormalities of posture and movement such as paralysis agitans (Parkinson's disease), striatonigral degeneration, progressive supranuclear palsy, torsion dystonia (torsion spasm; dystonia musculorum deformans),
15 spasmodic torticollis and other dyskinesia, familial tremor, and Gilles de la Tourette syndrome.
- IV. Syndromes of progressive ataxia such as cerebellar degenerations (e.g., cerebellar cortical degeneration and olivopontocerebellar atrophy (OPCA)); and spinocerebellar degeneration (Friedreich's ataxia and related disorders).
- 20 V. Syndrome of central autonomic nervous system failure (Shy-Drager syndrome).
- VI. Syndromes of muscular weakness and wasting without sensory changes (motorneuron disease such as amyotrophic lateral sclerosis, spinal muscular atrophy (e.g., infantile spinal muscular atrophy (Werdnig-Hoffman), juvenile spinal muscular atrophy (Wohlfart-Kugelberg-Welander) and other forms of familial spinal muscular atrophy),
25 primary lateral sclerosis, and hereditary spastic paraplegia.
- VII. Syndromes combining muscular weakness and wasting with sensory changes (progressive neural muscular atrophy; chronic familial polyneuropathies) such as peroneal muscular atrophy (Charcot-Marie-Tooth), hypertrophic interstitial polyneuropathy (Dejerine-Sottas), and miscellaneous forms of chronic progressive neuropathy.
- 30 VIII. Syndromes of progressive visual loss such as pigmentary degeneration of the retina (retinitis pigmentosa), and hereditary optic atrophy (Leber's disease).

Combination therapy:

The methods of the present invention may also comprise initially administering to the subject an antitumor agent so as to render the neoplastic cells in the subject resistant to an antitumor agent and subsequently administering an effective amount of any of the compositions of the present invention, effective to selectively induce terminal differentiation, cell growth arrest and/or apoptosis of such cells, or to treat cancer or provide chemoprevention.

The antitumor agent may be one of numerous chemotherapy agents such as an alkylating agent, an antimetabolite, a hormonal agent, an antibiotic, colchicine, a vinca alkaloid, L-asparaginase, procarbazine, hydroxyurea, mitotane, nitrosoureas or an imidazole carboxamide. Suitable agents are those agents that promote depolarization of tubulin. Preferably the antitumor agent is colchicine or a vinca alkaloid; especially preferred are vinblastine and vincristine. In embodiments where the antitumor agent is vincristine, the cells preferably are treated so that they are resistant to vincristine at a concentration of about 5 mg/ml. The treating of the cells to render them resistant to an antitumor agent may be effected by contacting the cells with the agent for a period of at least 3 to 5 days. The contacting of the resulting cells with any of the compounds above is performed as described previously. In addition to the above chemotherapy agents, the compounds may also be administered together with radiation therapy.

20

Dosages and Dosage Schedules

The dosage regimen utilizing the HDAC inhibitors can be selected in accordance with a variety of factors including type, species, age, weight, sex and the type of cancer being treated; the severity (i.e., stage) of the cancer to be treated; the route of administration; the renal and hepatic function of the patient; and the particular compound or salt thereof employed. An ordinarily skilled physician or veterinarian can readily determine and prescribe the effective amount of the drug required to treat, for example, to prevent, inhibit (fully or partially) or arrest the progress of the disease.

Suitable dosages are total daily dosage of between about 25-4000 mg/m² administered orally once-daily, twice-daily or three times-daily, continuous (every day) or intermittently (e.g., 3-5 days a week). For example, SAHA or any one of the HDAC inhibitors can be administered in a total daily dose of up to 800 mg, The HDAC inhibitor

30

can be administered once daily (QD), or divided into multiple daily doses such as twice daily (BID), and three times daily (TID). The HDAC inhibitor can be administered at a total daily dosage of up to 800 mg, e.g., 150 mg, 200 mg, 300 mg, 400 mg, 600 mg or 800 mg, which can be administered in one daily dose or can be divided into multiple daily
5 doses as described above. Preferably, the administration is oral.

In one embodiment, the composition is administered once daily at a dose of about 200-600 mg. In another embodiment, the composition is administered twice daily at a dose of about 200-400 mg. In another embodiment, the composition is administered twice daily at a dose of about 200-400 mg intermittently, for example three, four or five days per
10 week. In another embodiment, the composition is administered three times daily at a dose of about 100-250 mg.

In one embodiment, the daily dose is 200 mg, which can be administered once-daily, twice-daily, or three-times daily. In one embodiment, the daily dose is 300 mg, which can be administered once-daily, twice-daily, or three-times daily. In one
15 embodiment, the daily dose is 400 mg, which can be administered once-daily or twice-daily. In one embodiment, the daily dose is 150 mg, which can be administered twice-daily or three-times daily.

In addition, the administration can be continuous, i.e., every day, or intermittently. The terms "intermittent" or "intermittently" as used herein means stopping and starting at
20 either regular or irregular intervals. For example, intermittent administration of an HDAC inhibitor may be administration one to six days per week or it may mean administration in cycles (e.g., daily administration for two to eight consecutive weeks, then a rest period with no administration for up to one week) or it may mean administration on alternate days.

25 A currently preferred treatment protocol comprises continuous administration (i.e., every day), once, twice or three times daily at a total daily dose in the range of about 200 mg to about 600 mg.

Another currently preferred treatment protocol comprises intermittent administration of between three to five days a week, once, twice or three times daily at a
30 total daily dose in the range of about 200 mg to about 600 mg.

In one particular embodiment, the HDAC inhibitor is administered continuously once daily at a dose of 400 mg or twice daily at a dose of 200 mg.

In another particular embodiment, the HDAC inhibitor is administered intermittently three days a week, once daily at a dose of 400 mg or twice daily at a dose of 200 mg.

5 In another particular embodiment, the HDAC inhibitor is administered intermittently four days a week, once daily at a dose of 400 mg or twice daily at a dose of 200 mg.

In another particular embodiment, the HDAC inhibitor is administered intermittently five days a week, once daily at a dose of 400 mg or twice daily at a dose of 200 mg.

10 In one particular embodiment, the HDAC inhibitor is administered continuously once daily at a dose of 600 mg, twice daily at a dose of 300 mg, or three times daily at a dose of 200 mg.

In another particular embodiment, the HDAC inhibitor is administered intermittently three days a week, once daily at a dose of 600 mg, twice daily at a dose of 15 300 mg, or three times daily at a dose of 200 mg.

In another particular embodiment, the HDAC inhibitor is administered intermittently four days a week, once daily at a dose of 600 mg, twice daily at a dose of 300 mg, or three times daily at a dose of 200 mg.

20 In another particular embodiment, the HDAC inhibitor is administered intermittently five days a week, once daily at a dose of 600 mg, twice daily at a dose of 300 mg, or three times daily at a dose of 200 mg.

In addition, the HDAC inhibitor may be administered according to any of the schedules described above, consecutively for a few weeks, followed by a rest period. For example, the HDAC inhibitor may be administered according to any one of the schedules 25 described above from two to eight weeks, followed by a rest period of one week, or twice daily at a dose of 300 mg for three to five days a week. In another particular embodiment, the HDAC inhibitor is administered three times daily for two consecutive weeks, followed by one week of rest.

30 It should be apparent to a person skilled in the art that the various dosages and dosing schedules described herein merely set forth specific embodiments and should not be construed as limiting the broad scope of the invention. Any permutations, variations

and combinations of the dosages and dosing schedules are included within the scope of the present invention.

Pharmaceutical compositions

5 The compounds of the invention, and derivatives, fragments, analogs, homologs pharmaceutically acceptable salts or hydrate thereof, can be incorporated into pharmaceutical compositions suitable for oral administration, together with a pharmaceutically acceptable carrier or excipient. Such compositions typically comprise a therapeutically effective amount of any of the compounds above, and a pharmaceutically
10 acceptable carrier. Preferably, the effective amount is an amount effective to selectively induce terminal differentiation of suitable neoplastic cells and less than an amount which causes toxicity in a patient.

Any inert excipient that is commonly used as a carrier or diluent may be used in the formulations of the present invention, such as for example, a gum, a starch, a sugar, a
15 cellulosic material, an acrylate, or mixtures thereof. A preferred diluent is microcrystalline cellulose. The compositions may further comprise a disintegrating agent (e.g., croscarmellose sodium) and a lubricant (e.g., magnesium stearate), and in addition may comprise one or more additives selected from a binder, a buffer, a protease inhibitor, a surfactant, a solubilizing agent, a plasticizer, an emulsifier, a stabilizing agent, a
20 viscosity increasing agent, a sweetener, a film forming agent, or any combination thereof. Furthermore, the compositions of the present invention may be in the form of controlled release or immediate release formulations.

One embodiment is a pharmaceutical composition for oral administration comprising a HDAC inhibitor or a pharmaceutically acceptable salt or hydrate thereof, microcrystalline cellulose, croscarmellose sodium and magnesium stearate. Another
25 embodiment has SAHA as the HDAC inhibitor. Another embodiment comprises 50-70% by weight of a HDAC inhibitor or a pharmaceutically acceptable salt or hydrate thereof, 20-40% by weight microcrystalline cellulose, 5-15% by weight croscarmellose sodium and 0.1-5% by weight magnesium stearate. Another embodiment comprises about 50-200
30 mg of a HDAC inhibitor.

In one embodiment, the pharmaceutical compositions are administered orally, and are thus formulated in a form suitable for oral administration, i.e., as a solid or a liquid

preparation. Suitable solid oral formulations include tablets, capsules, pills, granules, pellets and the like. Suitable liquid oral formulations include solutions, suspensions, dispersions, emulsions, oils and the like. In one embodiment of the present invention, the composition is formulated in a capsule. In accordance with this embodiment, the compositions of the present invention comprise in addition to the HDAC inhibitor active compound and the inert carrier or diluent, a hard gelatin capsule.

As used herein, "pharmaceutically acceptable carrier" is intended to include any and all solvents, dispersion media, coatings, antibacterial and antifungal agents, isotonic and absorption delaying agents, and the like, compatible with pharmaceutical administration, such as sterile pyrogen-free water. Suitable carriers are described in the most recent edition of Remington's Pharmaceutical Sciences, a standard reference text in the field, which is incorporated herein by reference. Preferred examples of such carriers or diluents include, but are not limited to, water, saline, finger's solutions, dextrose solution, and 5% human serum albumin. Liposomes and non-aqueous vehicles such as fixed oils may also be used. The use of such media and agents for pharmaceutically active substances is well known in the art. Except insofar as any conventional media or agent is incompatible with the active compound, use thereof in the compositions is contemplated. Supplementary active compounds can also be incorporated into the compositions.

Solid carriers/diluents include, but are not limited to, a gum, a starch (e.g., corn starch, pregelatinized starch), a sugar (e.g., lactose, mannitol, sucrose, dextrose), a cellulosic material (e.g., microcrystalline cellulose), an acrylate (e.g., polymethylacrylate), calcium carbonate, magnesium oxide, talc, or mixtures thereof.

For liquid formulations, pharmaceutically acceptable carriers may be aqueous or non-aqueous solutions, suspensions, emulsions or oils. Examples of non-aqueous solvents are propylene glycol, polyethylene glycol, and injectable organic esters such as ethyl oleate. Aqueous carriers include water, alcoholic/aqueous solutions, emulsions or suspensions, including saline and buffered media. Examples of oils are those of petroleum, animal, vegetable, or synthetic origin, for example, peanut oil, soybean oil, mineral oil, olive oil, sunflower oil, and fish-liver oil. Solutions or suspensions can also include the following components: a sterile diluent such as water for injection, saline solution, fixed oils, polyethylene glycols, glycerine, propylene glycol or other synthetic solvents; antibacterial agents such as benzyl alcohol or methyl parabens; antioxidants such

as ascorbic acid or sodium bisulfite; chelating agents such as ethylenediaminetetraacetic acid (EDTA); buffers such as acetates, citrates or phosphates, and agents for the adjustment of tonicity such as sodium chloride or dextrose. The pH can be adjusted with acids or bases, such as hydrochloric acid or sodium hydroxide.

5 In addition, the compositions may further comprise binders (e.g., acacia, cornstarch, gelatin, carbomer, ethyl cellulose, guar gum, hydroxypropyl cellulose, hydroxypropyl methyl cellulose, povidone), disintegrating agents (e.g., cornstarch, potato starch, alginic acid, silicon dioxide, croscarmellose sodium, crospovidone, guar gum, sodium starch glycolate, Primogel), buffers (e.g., tris-HCl, acetate, phosphate) of various
10 pH and ionic strength, additives such as albumin or gelatin to prevent absorption to surfaces, detergents (e.g., Tween 20, Tween 80, Pluronic F68, bile acid salts), protease inhibitors, surfactants (e.g., sodium lauryl sulfate), permeation enhancers, solubilizing agents (e.g., glycerol, polyethylene glycerol), a glidant (e.g., colloidal silicon dioxide), anti-oxidants (e.g., ascorbic acid, sodium metabisulfite, butylated hydroxyanisole),
15 stabilizers (e.g., hydroxypropyl cellulose, hydroxypropylmethyl cellulose), viscosity increasing agents (e.g., carbomer, colloidal silicon dioxide, ethyl cellulose, guar gum), sweeteners (e.g., sucrose, aspartame, citric acid), flavoring agents (e.g., peppermint, methyl salicylate, or orange flavoring), preservatives (e.g., Thimerosal, benzyl alcohol, parabens), lubricants (e.g., stearic acid, magnesium stearate, polyethylene glycol, sodium
20 lauryl sulfate), flow-aids (e.g., colloidal silicon dioxide), plasticizers (e.g., diethyl phthalate, triethyl citrate), emulsifiers (e.g., carbomer, hydroxypropyl cellulose, sodium lauryl sulfate), polymer coatings (e.g., poloxamers or poloxamines), coating and film forming agents (e.g., ethyl cellulose, acrylates, polymethacrylates) and/or adjuvants.

 In one embodiment, the active compounds are prepared with carriers that will
25 protect the compound against rapid elimination from the body, such as a controlled release formulation, including implants and microencapsulated delivery systems. Biodegradable, biocompatible polymers can be used, such as ethylene vinyl acetate, polyanhydrides, polyglycolic acid, collagen, polyorthoesters, and polylactic acid. Methods for preparation of such formulations will be apparent to those skilled in the art. The materials can also be
30 obtained commercially from Alza Corporation and Nova Pharmaceuticals, Inc. Liposomal suspensions (including liposomes targeted to infected cells with monoclonal antibodies to viral antigens) can also be used as pharmaceutically acceptable carriers. These can be

prepared according to methods known to those skilled in the art, for example, as described in U.S. Patent No. 4,522,811.

It is especially advantageous to formulate oral compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used herein
5 refers to physically discrete units suited as unitary dosages for the subject to be treated; each unit containing a predetermined quantity of active compound calculated to produce the desired therapeutic effect in association with the required pharmaceutical carrier. The specification for the dosage unit forms of the invention are dictated by and directly dependent on the unique characteristics of the active compound and the particular
10 therapeutic effect to be achieved, and the limitations inherent in the art of compounding such an active compound for the treatment of individuals.

The pharmaceutical compositions can be included in a container, pack, or dispenser together with instructions for administration.

The compounds of the present invention may be administered intravenously on the
15 first day of treatment, with oral administration on the second day and all consecutive days thereafter.

The compounds of the present invention may be administered for the purpose of preventing disease progression or stabilizing tumor growth.

The preparation of pharmaceutical compositions that contain an active component
20 is well understood in the art, for example, by mixing, granulating, or tablet-forming processes. The active therapeutic ingredient is often mixed with excipients that are pharmaceutically acceptable and compatible with the active ingredient. For oral administration, the active agents are mixed with additives customary for this purpose, such as vehicles, stabilizers, or inert diluents, and converted by customary methods into suitable
25 forms for administration, such as tablets, coated tablets, hard or soft gelatin capsules, aqueous, alcoholic or oily solutions and the like as detailed above.

The amount of the compound administered to the patient is less than an amount that would cause toxicity in the patient. In the certain embodiments, the amount of the compound that is administered to the patient is less than the amount that causes a
30 concentration of the compound in the patient's plasma to equal or exceed the toxic level of the compound. Preferably, the concentration of the compound in the patient's plasma is maintained at about 10 nM. In another embodiment, the concentration of the compound in

the patient's plasma is maintained at about 25 nM. In another embodiment, the concentration of the compound in the patient's plasma is maintained at about 50 nM. In another embodiment, the concentration of the compound in the patient's plasma is maintained at about 100 nM. In another embodiment, the concentration of the compound in the patient's plasma is maintained at about 500 nM. In another embodiment, the concentration of the compound in the patient's plasma is maintained at about 1000 nM. In another embodiment, the concentration of the compound in the patient's plasma is maintained at about 2500 nM. In another embodiment, the concentration of the compound in the patient's plasma is maintained at about 5000 nM. It has been found with HMBA that administration of the compound in an amount from about 5 gm/m²/day to about 30 gm/m²/day, particularly about 20 gm/m²/day, is effective without producing toxicity in the patient. The optimal amount of the compound that should be administered to the patient in the practice of the present invention will depend on the particular compound used and the type of cancer being treated.

In a currently preferred embodiment of the present invention, the pharmaceutical composition comprises a histone deacetylase (HDAC) inhibitor; microcrystalline cellulose as a carrier or diluent; croscarmellose sodium as a disintegrant; and magnesium stearate as a lubricant. In another currently preferred embodiment, the HDAC inhibitor is suberoylanilide hydroxamic acid (SAHA). Another currently preferred embodiment of the invention is a solid formulation of SAHA with microcrystalline cellulose, NF (Avicel Ph 101), sodium croscarmellose, NF (AC-Di-Sol) and magnesium stearate, NF, contained in a gelatin capsule.

The percentage of the active ingredient and various excipients in the formulations may vary. For example, the composition may comprise between 20 and 90%, preferably between 50-70% by weight of the histone deacetylase (HDAC). Furthermore, the composition may comprise between 10 and 70%, preferably between 20-40% by weight microcrystalline cellulose as a carrier or diluent. Furthermore, the composition may comprise between 1 and 30%, preferably 5-15% by weight croscarmellose sodium as a disintegrant. Furthermore, the composition may comprise between 0.1-5% by weight magnesium stearate as a lubricant. In another preferred embodiment, the composition comprises about 50-200 mg of the HDAC inhibitor (e.g., 50 mg, 100 mg and 200 mg for

the HDAC inhibitor, for example, SAHA). In a particularly preferred embodiment, the composition is in the form of a gelatin capsule.

A currently preferred embodiment is 200 mg of solid SAHA with 89.5 mg of microcrystalline cellulose, 9 mg of sodium croscarmellose and 1.5 mg of magnesium stearate contained in a gelatin capsule.

In Vitro Methods:

The present invention also provides *in-vitro* methods for selectively inducing terminal differentiation, cell growth arrest and/or apoptosis of neoplastic cells, e.g., leukemia cells, thereby inhibiting proliferation of such cells, by contacting the cells with an effective amount of a an HDAC inhibitor, e.g., SAHA, or a pharmaceutically acceptable salt or hydrate thereof.

The present invention also provides *in-vitro* methods for inhibiting the activity of a histone deacetylase, by the histone deacetylase with an effective amount of an HDAC inhibitor, e.g., SAHA, or a pharmaceutically acceptable salt or hydrate thereof.

Although the methods of the present invention can be practiced *in vitro*, it is contemplated that the preferred embodiment for the methods of selectively inducing terminal differentiation, cell growth arrest and/or apoptosis of neoplastic cells, and of inhibiting HDAC will comprise contacting the cells *in vivo*, i.e., by administering the compounds to a subject harboring neoplastic cells or tumor cells in need of treatment.

Thus, the present invention also provides methods for selectively inducing terminal differentiation, cell growth arrest and/or apoptosis of neoplastic cells, e.g., leukemia cells in a subject, thereby inhibiting proliferation of such cells in said subject, by administering to the subject a pharmaceutical composition comprising an effective amount of an HDAC inhibitor, e.g., SAHA, or a pharmaceutically acceptable salt or hydrate thereof, and a pharmaceutically acceptable carrier or diluent. An effective amount of an HDAC inhibitor in the present invention can be up to a total daily dose of 800 mg.

The present invention also provides methods for inhibiting the activity of a histone deacetylase in a subject, by administering to the subject a pharmaceutical composition comprising an effective amount of an HDAC inhibitor, e.g., SAHA, or a pharmaceutically acceptable salt or hydrate thereof, and a pharmaceutically acceptable carrier or diluent.

An effective amount of an HDAC inhibitor in the present invention can be up to a total daily dose of 800 mg.

The invention is illustrated in the examples in the Experimental Details Section that follows. This section is set forth to aid in an understanding of the invention but is not
5 intended to, and should not be construed to limit in any way the invention as set forth in the claims which follow thereafter.

EXPERIMENTAL DETAILS SECTION

EXAMPLE 1:

Synthesis of SAHA

- 5 SAHA can be synthesized according to the method outlined below, or according to the method set forth in US Patent 5,369,108, the contents of which are incorporated by reference in their entirety, or according to any other method.

Synthesis of SAHA

Step 1 – Synthesis of Suberanic acid

- 10 In a 22 L flask was placed 3,500 g (20.09 moles) of suberic acid, and the acid melted with heat. The temperature was raised to 175°C, and then 2,040 g (21.92 moles) of aniline was added. The temperature was raised to 190°C and held at that temperature for 20 minutes. The melt was poured into a Nalgene tank that contained 4,017 g of potassium hydroxide dissolved in 50 L of water. The mixture was stirred for 20 minutes following the addition of the melt. The reaction was repeated at the same scale, and the second melt
- 15 was poured into the same solution of potassium hydroxide. After the mixture was thoroughly stirred, the stirrer was turned off, and the mixture was allowed to settle. The mixture was then filtered through a pad of Celite (4,200 g) (the product was filtered to remove the neutral by-product (from attack by aniline on both ends of suberic acid). The filtrate contained the salt of the product, and also the salt of unreacted suberic acid. The
- 20 mixture was allowed to settle because the filtration was very slow, taking several days.). The filtrate was acidified using 5 L of concentrated hydrochloric acid; the mixture was stirred for one hour, and then allowed to settle overnight. The product was collected by filtration, and washed on the funnel with deionized water (4 x 5 L). The wet filter cake was placed in a 72 L flask with 44 L of deionized water, the mixture heated to 50°C, and
- 25 the solid isolated by a hot filtration (the desired product was contaminated with suberic

acid which is has a much greater solubility in hot water. Several hot triturations were done to remove suberic acid. The product was checked by NMR [D_6 DMSO] to monitor the removal of suberic acid). The hot trituration was repeated with 44 L of water at 50°C. The product was again isolated by filtration, and rinsed with 4 L of hot water. It was dried over
5 the weekend in a vacuum oven at 65°C using a Nash pump as the vacuum source (the Nash pump is a liquid ring pump (water) and pulls a vacuum of about 29 inch of mercury. An intermittent argon purge was used to help carry off water); 4,182.8 g of suberanilic acid was obtained.

The product still contained a small amount of suberic acid; therefore the hot
10 trituration was done portionwise at 65°C, using about 300 g of product at a time. Each portion was filtered, and rinsed thoroughly with additional hot water (a total of about 6 L). This was repeated to purify the entire batch. This completely removed suberic acid from the product. The solid product was combined in a flask and stirred with 6 L of methanol/water (1:2), and then isolated by filtration and air dried on the filter over the
15 week end. It was placed in trays and dried in a vacuum oven at 65°C for 45 hours using the Nash pump and an argon bleed. The final product has a weight of 3,278.4 g (32.7% yield).

Step 2 –Synthesis of Methyl Suberanilate

To a 50 L flask fitted with a mechanical stirrer, and condenser was placed 3,229 g of suberanilic acid from the previous step, 20 L of methanol, and 398.7 g of Dowex 50WX2-400 resin. The mixture was heated to reflux and held at reflux for 18 hours. The mixture was filtered to remove the resin beads, and the filtrate was taken to a residue on a rotary evaporator.

The residue from the rotary evaporator was transferred into a 50 L flask fitted with a condenser and mechanical stirrer. To the flask was added 6 L of methanol, and the mixture heated to give a solution. Then 2 L of deionized water was added, and the heat turned off. The stirred mixture was allowed to cool, and then the flask was placed in an ice bath, and the mixture cooled. The solid product was isolated by filtration, and the filter cake was rinsed with 4 L of cold methanol/water (1:1). The product was dried at 45°C in a vacuum oven using a Nash pump for a total of 64 hours to give 2,850.2 g (84% yield) of methyl suberanilate, CSL Lot # 98-794-92-3 1.

Step 3 – Synthesis of Crude SAHA

To a 50 L flask with a mechanical stirrer, thermocouple, and inlet for inert atmosphere was added 1,451.9 g of hydroxylamine hydrochloride, 19 L of anhydrous methanol, and a 3.93 L of a 30% sodium methoxide solution in methanol. The flask was then charged with 2,748.0 g of methyl suberanilate, followed by 1.9 L of a 30% sodium methoxide solution in methanol. The mixture was allowed to stir for 16 hr and 10 minutes. Approximately one half of the reaction mixture was transferred from the reaction flask (flask 1) to a 50 L flask (flask 2) fitted with a mechanical stirrer. Then 27 L of deionized water was added to flask 1 and the mixture was stirred for 10 minutes. The pH was taken using a pH meter; the pH was 11.56. The pH of the mixture was adjusted to 12.02 by the

addition of 100 ml of the 30% sodium methoxide solution in methanol; this gave a clear solution (the reaction mixture at this time contained a small amount of solid. The pH was adjusted to give a clear solution from which the precipitation the product would be precipitated). The reaction mixture in flask 2 was diluted in the same manner; 27 L of
5 deionized water was added, and the pH adjusted by the addition of 100 ml of a 30 % sodium methoxide solution to the mixture, to give a pH of 12.01 (clear solution).

The reaction mixture in each flask was acidified by the addition of glacial acetic acid to precipitate the product. Flask 1 had a final pH of 8.98, and Flask 2 had a final pH of 8.70. The product from both flasks was isolated by filtration using a Buchner funnel and
10 filter cloth. The filter cake was washed with 15 L of deionized water, and the funnel was covered and the product was partially dried on the funnel under vacuum for 15.5 hr. The product was removed and placed into five glass trays. The trays were placed in a vacuum oven and the product was dried to constant weight. The first drying period was for 22 hours at 60°C using a Nash pump as the vacuum source with an argon bleed. The trays
15 were removed from the vacuum oven and weighed. The trays were returned to the oven and the product dried for an additional 4 hr and 10 minutes using an oil pump as the vacuum source and with no argon bleed. The material was packaged in double 4-mill polyethylene bags, and placed in a plastic outer container. The final weight after sampling was 2633.4 g (95.6%).

20 Step 4 – Recrystallization of Crude SAHA

The crude SAHA was recrystallized from methanol/water. A 50 L flask with a mechanical stirrer, thermocouple, condenser, and inlet for inert atmosphere was charged with the crude SAHA to be crystallized (2,525.7 g), followed by 2,625 ml of deionized
25 water and 15,755 ml of methanol. The material was heated to reflux to give a solution. Then 5,250 ml of deionized water was added to the reaction mixture. The heat was turned off, and the mixture was allowed to cool. When the mixture had cooled sufficiently so that the flask could be safely handled (28°C), the flask was removed from the heating mantle, and placed in a tub for use as a cooling bath. Ice/water was added to the tub to cool the
30 mixture to -5°C. The mixture was held below that temperature for 2 hours. The product was isolated by filtration, and the filter cake washed with 1.5 L of cold methanol/water (2:1). The funnel was covered, and the product was partially dried under vacuum for 1.75 hr. The product was removed from the funnel and placed in 6 glass trays. The trays were placed in a vacuum oven, and the product was dried for 64.75 hr at 60°C using a Nash

pump as the vacuum source, and using an argon bleed. The trays were removed for weighing, and then returned to the oven and dried for an additional 4 hours at 60°C to give a constant weight. The vacuum source for the second drying period was a oil pump, and no argon bleed was used. The material was packaged in double 4-mill polyethylene bags, and placed in a plastic outer container. The final weight after sampling was 2,540.9 g (92.5%).

EXAMPLE 2:

Oral dosing of suberoylanilide hydroxamic acid (SAHA)

10 Background: Treatment with hybrid polar cellular differentiation agents has resulted in the inhibition of growth of human solid tumor derived cell lines and xenografts. The effect is mediated in part by inhibition of histone deacetylase. SAHA is a potent histone deacetylase inhibitor that has been shown to have the ability to induce tumor cell growth arrest, differentiation and apoptosis in the laboratory and in preclinical studies.

15 Objectives: To define a safe daily oral regimen of SAHA that can be used in Phase II studies. In addition, the pharmacokinetic profile of the oral formulation of SAHA was be evaluated. The oral bioavailability of SAHA in humans in the fasting vs. non-fasting state and anti-tumor effects of treatment were also monitored. Additionally, the biological effects of SAHA on normal tissues and tumor cells were assessed and
20 responses with respect to levels of histone acetylation were documented.

Patients: Patients with histologically documented advanced stage, primary or metastatic adult solid tumors that are refractory to standard therapy or for which no curative standard therapy exists. Patients must have a Karnofsky Performance Status of $\geq 70\%$, and adequate hematologic, hepatic and renal function. Patients must be at least
25 four weeks from any prior chemotherapy, radiation therapy or other investigational anticancer drugs.

Dosing Schedule: On the first day, patients were first treated with 200 mg of intravenously-administered SAHA. Starting on the second day, patients were treated with daily doses of oral SAHA according to Table 1. Each cohort received a different dose of
30 SAHA. "QD" indicates dosing once a day; "Q12 hours" indicates dosing twice a day. For example, patients in Cohort IV received two 800 mg doses of SAHA per day. Doses were administered to patients daily and continuously. Blood samples were taken on day one and on day 21 of oral treatment. Patients were taken off oral SAHA treatment due to

disease progression, tumor regression, unacceptable side effects, or treatment with other therapies.

Table 1: Oral SAHA Dose Schedule

Cohort	Oral Dose (mg)	Number of Days	Daily Dosing Schedule
I	200	Continuous	QD
II	400	Continuous	QD
III	400	Continuous	Q12 hours
IV	800	Continuous	Q12 hours
V	1200	Continuous	Q12 hours
VI	1600	Continuous	Q12 hours
VII	2000	Continuous	Q12 hours

5

Results: Comparison of serum plasma levels shows high bioavailability of SAHA administered orally, both when the patient fasted and when the patient did not fast, compared to SAHA administered intravenously (IV SAHA). "AUC" is an estimate of the bioavailability of SAHA in (ng/ml)min, where 660 ng/ml is equal to 2.5 μ M SAHA. The AUC taken together with the half-life ($t_{1/2}$) shows that the overall bioavailability of oral SAHA is better than that of IV SAHA. C_{max} is the maximum concentration of SAHA observed after administration. IV SAHA was administered at 200 mg infused over two hours. The oral SAHA was administered in a single capsule at 200 mg. Tables 2 and 3 summarize the results of an HPLC assay (LCMS using a deuterated standard) that quantitates the amount of SAHA in the blood plasma of the patients versus time, using acetylated histone-4 (α -AcH4) as a marker.

10

15

Table 2: Serum Plasma Levels of Oral SAHA – Patient #1

	IV	Oral (fasting)	Oral (nonfasting)
C_{max} (ng/ml)	1329	225	328
$t_{1/2}$ (min)	20	80	64
AUC (ng/ml)min	153,000	25,000	59,000

20

Table 3: Serum Plasma Levels of Oral SAHA – Patient #2

	IV	Oral (fasting)	Oral (nonfasting)
--	----	----------------	-------------------

C _{max} (ng/ml)	1003	362	302
t _{1/2} (min)	21	82	93
AUC (ng/ml)min	108,130	63,114	59,874

Figures 1 to 8 are HPLC slides showing the amount of α -AcH4 in patients in Cohorts I and II, measured at up to 10 hours after receiving the oral dose, compared with the α -AcH4 levels when SAHA was administered intravenously. Fig 9 shows the mean plasma concentration of SAHA (ng/ml) at the indicated time points following administration. Fig 9A: Oral dose (200 mg and 400 mg) under fasting on Day 8. Fig 9B: Oral dose (200 mg and 400 mg) with food on Day 9. Fig 9C: IV dose on day 1. Fig 10 shows the apparent half-life of a SAHA 200 mg and 400 mg oral dose, on Days 8, 9 and 22. Fig 11 shows the AUC (ng/ml/hr) of a SAHA 200 mg and 400 mg oral dose, on Days 8, 9 and 22. Figure 12 shows the bioavailability of SAHA after a 200 mg and 400 mg oral dose, on Days 8, 9 and 22.

EXAMPLE 3:

Oral dosing of suberoylanilide hydroxamic acid (SAHA) – Dose Escalation.

In another experiment, twenty-five patients with solid tumors have been enrolled onto arm A, thirteen patients with Hodgkin's or non-Hodgkin's lymphomas have been enrolled onto arm B, and one patient with acute leukemia and one patient with myelodysplastic syndrome have been enrolled onto arm C, as shown in Table 4.

Table 4: Dose Escalation Scheme and Number of Patients on Each Dose Level

Cohort	Dose (mg/day)	Dosing Schedule	#Days of Dosing	Rest Period	#Patients Enrolled (arm A/arm B/arm C)*
I	200	Once a day	Continuous	None	6/0/0
II	400	Once a day	Continuous	None	5/4/2
III	400	q 12 hours	Continuous	None	6/3/0
IV	600	Once a day	Continuous	None	4/3/0
V	200	q 12 hours	Continuous	None	4/3/0
VI	300	q 12 hours	Continuous	None	-/-/-
					Sub-totals: 25/13/2
					Total = 40

*Arm A= solid tumor, arm B= lymphoma, arm C= leukemia

Results:

Among eleven patients treated in Cohort II, one patient experienced the DLT of grade 3 diarrhea and grade 3 dehydration during the first treatment cycle. Nine patients were entered into Cohort III. Two patients were unevaluable for the 28-day toxicity assessment because of early study termination due to rapid progression of disease. Of the seven remaining patients, five experienced DLT during the first treatment cycle: diarrhea/dehydration (n=1), fatigue/dehydration (n=1), anorexia (n=1), dehydration (n=1) and anorexia/dehydration (n=1). These five patients recovered in approximately one week after the study drug was held. They were subsequently dose-reduced to 400 mg QD, which appeared to be well tolerated. The median days on 400 mg BID for all patients in Cohort III was 21 days. Based on these findings the 400 mg q12 hour dosing schedule was judged to have exceeded the maximally tolerated dose. Following protocol amendment, accrual was continued in cohort IV at a dose of 600 mg once a day. Of the seven patients enrolled onto cohort IV, two were not evaluable for the 28-day toxicity assessment because of early study termination due to rapid progression of disease. Three patients experienced DLT during the first treatment cycle: anorexia/dehydration/fatigue (n=1), and diarrhea/dehydration (n=2). The 600 mg dose was therefore judged to have exceeded the maximally tolerated dose and the 400 mg once a day dose was defined as the maximally tolerated dose for once daily oral administration. The protocol was amended to evaluate additional dose levels of the twice a day dosing schedule at 200 mg BID and 300 mg BID administered continuously.

The interim pharmacokinetic analysis was based on 18 patients treated on the dose levels of 200 mg QD, 400 mg QD, and 400 mg BID. In general, the mean estimates of C_{max} and AUC_{inf} of SAHA administered orally under fasting condition or with food increased proportionally with dose in the 200 mg to 400 mg dose range. Overall, the fraction of AUC_{inf} due to extrapolation was 1% or less. Mean estimates for apparent half-life were variable across dose groups under fasting condition or with food, ranging from 61 to 114 minutes. The mean estimates of C_{max} , varies from 233 ng/ml (0.88 μ M) to 570 ng/ml (2.3 μ M). The bioavailable fraction of SAHA, calculated from the AUC_{inf} values after the IV infusion and oral routes, was found to be approximately 0.48.

Peripheral blood mononuclear cells were collected pre-therapy, immediately post-infusion and between 2 - 10 hours after oral ingestion of the SAHA capsules to assess the effect of SAHA on the extent of histone acetylation in a normal host cell. Histones were isolated and probed with anti-acetylated histone (H3) antibody followed by HRP-

secondary antibody. Preliminary analysis demonstrated an increase in the accumulation of acetylated histones in peripheral mononuclear cells that could be detected up to 10 hours after ingestion of SAHA capsules at 400 mg per day dose level.

Thirteen patients continued treatment for 3-12 months with responding or stable disease: thyroid (n=3), sweat gland (n=1), renal (n=2), larynx (n=1), prostate (n=1), Hodgkin's lymphoma (n=2), non-Hodgkin's lymphoma (n=2), and leukemia (n=1).

Six patients had tumor shrinkage on CT scans. Three of these six patients meet the criteria of partial response (one patient with metastatic laryngeal cancer and two patients with non-Hodgkin's lymphomas). These partial responses occurred at the dose levels of 400 mg BID (n=2) and 600 mg QD (n=1).

The dosages described above have also been administered twice daily intermittently. Patients have received SAHA twice daily three to five days per week. Patient response has been seen with administration of SAHA twice daily at 300 mg for three days a week.

EXAMPLE 4:

Intravenous Dosing of SAHA

Table 5 shows a dosing schedule for patients receiving SAHA intravenously. Patients begin in Cohort I, receiving 300 mg/m² of SAHA for five consecutive days in a week for one week, for a total dose of 1500 mg/m². Patients were then observed for a period of two weeks and continued to Cohort II, then progressed through the Cohorts unless treatment was terminated due to disease progression, tumor regression, unacceptable side effects or the patient received other treatment.

Table 5: Standard Dose Escalation for Intravenously-Administered SAHA

Cohort	Dose (mg/m ²)	Number of Days/Week	Number of Consecutive Weeks	Observation Period (Weeks)	Total Dose (mg/m ²)
I	300	5	1	2	1500
II	300	5	2	2	3000
III	300	5	3	1*	4500
IV	600	5	3	1*	9000
V	800	5	3	1*	13500
VI	1200	5	3	1*	18000
VII	1500	5	3	1*	22500

*Hematologic patients started at dose level III.

EXAMPLE 5:

Treatment of Leukemia with SAHA

5 A phase I study of oral SAHA in patients with advanced leukemias and myelodysplastic syndrome (MDS) was conducted. Patients received SAHA orally (po) three times (tid) a day for 14 days followed by 1 week of rest, for a 3-week course. The initial dose level was 100 mg po tid. Dose escalation was in increments of 50 mg po tid, with cohorts of N=3, using a classic "3+3" model.

10 Prior studies have shown that a single dose of oral SAHA could lead to histone hyperacetylation in peripheral blood mononuclear cells lasting up to 10 hours, and prolonged histone hyperacetylation may be associated with superior anti-tumor activities. The intention of the tid schedule is to induce continuous histone hyperacetylation in vivo for 14 days followed by 1 week of rest to allow recovery from potential toxicities.

15 Eligible patients had relapsed/refractory leukemias and MDS, or untreated disease if not willing to proceed with conventional systemic chemotherapy, preserved organ function and good performance status.

Results:

20 Six patients have been treated and are evaluable for toxicity. No grade III-IV non-hematological or hematological toxicity has been observed thus far. This schedule has been well tolerated without excessive asthenia or anorexia.

25 At the dose level 1, one patient with CMML progressed after 1 course of therapy, one patient with untreated AML progressed after 2 courses of therapy and 1 patient with relapsed AML has completed four courses of therapy, with disappearance of peripheral blasts and improvement of bone marrow blasts (from 26% to 7% on course 3 day 21), but without recovery of peripheral blood counts.

At dose level 2, one patient with relapsed AML progressed on day 18 of first course, one patient with relapsed ALL progressed on day 13 of course 1, and one patient with CLL received course 2 of therapy without disease progression.

30 Analysis of histone acetylation from peripheral blood and bone marrow specimens obtained pretreatment and on days 14 and 22 showed that histone hyperacetylation was induced both in the peripheral blood and marrow of all three patients treated at dose level 1.

Further, one patient with CLL received SAHA three times daily at a dose of 150 mg for 1 cycle of treatment. As determined by a CT scan of lymph nodes (groin area), there was a shrinkage of the lymph nodes following treatment with SAHA. Inguinal nodes measured approximately 4.6 cm before SAHA treatment, and 3.8 cm after SAHA treatment. Another inguinal node measured approximately 5.3x3.1 before SAHA treatment, and 5x2.8 after SAHA treatment.

The results demonstrate that SAHA is effective at treating leukemia in patients.

While this invention has been particularly shown and described with references to preferred embodiments thereof, it will be understood by those skilled in the art that various changes in form and details may be made therein without departing from the meaning of the invention described. Rather, the scope of the invention is defined by the claims that follow:
